5.5 Setup: Start the application 69
5.6 Automatically restore system files 70
5.7 Exit setup, reboot device 71

6 First steps 72

6.1 Start CODESYS 73
6.2 Create CODESYS project 74
6.2.1 Create new project with CR1200 75
6.2.2 Add visualisation to the project 76
6.2.3 Overview: Project structure with CR1200 76
6.3 Use CODESYS user manual 77
6.4 Configure programming interface 78
6.4.1 Set communication path of PLC 78
6.5 Add ifm function libraries to the application 79
6.6 Activate the access protection for a project 79
6.7 Access the Linux system of the device 80

7 System configuration 81

7.1 Configure PLC 82
7.2 Configure inputs and outputs 83
7.2.1 Set operating mode of the inputs 84
7.2.2 Set operating mode of the outputs 84
7.3 Configure device keys 85
7.3.1 Set the brightness of the key LEDs 86
7.3.2 Set key assignment (key mapping) 86
7.4 Configure CAN interfaces 87
7.4.1 Add and configure CANbus 88
7.4.2 RawCAN: Configure CANLayer 2 89
7.4.3 CANopen: Configure CANopen Manager (master) 89
7.4.4 CANopen: Configure CANopen Device (slave) 90
7.4.5 J1939: Configure J1939 Manager 91

8 Programming 92

8.1 Objects of a PLC application 93
8.2 Create PLC application 94
8.2.1 Notes 94
8.3 Use ifm function libraries 99
8.3.1 Configure system 100
8.3.2 Configure Ethernet interface 100
8.3.3 Control device 100
8.3.4 Manage files 101
8.3.5 Manage CSV files 101
8.3.6 Use help functions 101
8.4 Use system flags 102
8.4.1 Access inputs and outputs 102
8.4.2 Read diagnostic data of the device 103
8.4.3 Set the brightness of the display 103
8.4.4 Control status LED 104
8.4.5 Control buzzer (audio signalling device) 104
8.4.6 Control key LEDs 105
8.5 Use visualisations 106
8.5.1 Notes about visualisations 107
8.5.2 Create visualisation 110
8.5.3 Use visualisation manager 111
8.5.4 Configure visualisation 113
8.6 Use mobile cameras 114
8.6.1 Supported cameras 115

© ifm electronic gmbh www.ifm.com

8.6.2 Activate extensions for mobile cameras 115
8.6.3 Use Ethernet camera in the project 116
8.6.4 Using analogue cameras in the project 120
8.7 Use CANopen 127
8.7.1 CANopen: Send and receive SDO 128
8.7.2 CANopen: Network Management (NMT) 128
8.8 Use RawCAN (CAN Layer 2) 129
8.8.1 RawCAN: Control CAN network nodes 130
8.8.2 RawCAN: Send and receive CAN messages 130
8.8.3 RawCAN: Request and send remote CAN messages 130
8.9 Configure task processing 131
8.9.1 Configure main task 132
8.9.2 Configure visualisation task 132

9 Operation 134

9.1 Transfer CODESYS project to the device 135
9.1.1 Load application to CR1200 136
9.1.2 Delete application from the device 136
9.2 Operating states of the PLC application 137
9.2.1 Display operating mode of the PLC application 137
9.2.2 Start PLC application 138
9.2.3 Stop PLC application 138
9.3 Reset 139
9.3.1 Supported reset variants 140
9.3.2 Reset application (warm) 140
9.3.3 Reset application (cold) 141
9.3.4 Reset application (origin) 141
9.4 Display system information 142

1.2 Purpose of the document

7296

This document applies to the following products from ifm electronic:

- Dialogue module PDM360 NG (art. no.: CR1200), firmware version V3.2.0.1 or higher

These instructions describe the following topics:

- Configuration of the device in the setup mode
- Firmware update of the device in the recovery mode
- Configuration of the device with CODESYS 3.5
- Programming of the device-internal PLC of the CR1200 by means of the CODESYS 3.5 programming system.
- Description of the device-specific CODESYS function libraries

1.4 Overview: User documentation for CR1200

9193

ifm electronic provides the following user documentation for the models of the device class "dialogue modules PDM360 NG":

Document	Contents / Description
Data sheet	Technical data in a table
Installation instructions *	▪ Instructions for installation, electrical installation and commissioning ▪ Technical data
Programming manual	▪ Functions of the setup menu of the device ▪ Creation of a CR1200 project with CODESYS 3.5 ▪ Target settings with CODESYS 3.5 ▪ Programming of the device-internal PLC with CODESYS 3.5 ▪ Description of the device-specific CODESYS function libraries

Legend:
*... The installation instructions are supplied with the device.

All documents can be downloaded from ifm's website:
→ www.ifm.com > Select country > [Data sheet search] > (Article no.) > [Operating instructions]

1.5 Overview: CODESYS documentation of 3S

9194

The following user documentation is provided by 3S GmbH for programming the CR1200 with CODESYS:

Document	Contents / Description
Online help	▪ Context-sensitive help ▪ Description of the CODESYS programming system
CODESYS installation and first steps	▪ Notes about the installation of the programming system CODESYS ▪ First steps for handling the programming system CODESYS

After the installation of the programming system CODESYS 3.5 all documents are stored on the hard disk of the PC/laptop and can be accessed:

- Online help:
  `...\Programme\3S CoDeSys\CoDeSys\Online-Help`
- CODESYS installation and first steps:
  `...\Programme\3S CoDeSys\CoDeSys\Documentation`

2.1 What previous knowledge is required?

215

This document is intended for people with knowledge of control technology and PLC programming with IEC 61131-3.

To program the PLC, the people should also be familiar with the CODESYS software.

The document is intended for specialists. These specialists are people who are qualified by their training and their experience to see risks and to avoid possible hazards that may be caused during operation or maintenance of a product. The document contains information about the correct handling of the product.

Read this document before use to familiarise yourself with operating conditions, installation and operation. Keep the document during the entire duration of use of the device.

Adhere to the safety instructions.

2.2 Note!

7328
11212

No characteristics are warranted with the information, notes and examples provided in this manual. With the drawings, representations and examples given no responsibility for the system is assumed and no application-specific particularities are taken into account.

- ► The manufacturer of the machine/equipment is responsible for ensuring the safety of the machine/equipment.
- ► Follow the national and international regulations of the country in which the machine/installation is to be placed on the market!

⚠ WARNING

Non-observance of these instructions can lead to property damage or personal injury.
ifm electronic gmbh does not assume any liability in this regard.

- ► The acting person must have read and understood the safety instructions and the corresponding chapters in this manual before working on and with this device.
- ► The acting person must be authorised to work on the machine/equipment.
- ► The acting person must have the qualifications and training required to perform this work.
- ► Adhere to the technical data of the devices!
  You can find the current data sheet on **ifm's** homepage at:
  → www.ifm.com > Select your country > [Data sheet search] > (article number) > [Technical data in PDF format]
- ► Note the installation and wiring information as well as the functions and features of the devices!
  → supplied installation instructions or on **ifm's** homepage:
  → www.ifm.com > Select your country > [Data sheet search] > (article number) > [Operating instructions]
- ► Please note the corrections and notes in the release notes for the existing documentation, available on the **ifm** website:
  → www.ifm.com > Select your country > [Data sheet search] > (article number) > [Operating instructions]

NOTICE

Danger of burn-in effects!

If the device is operated with the same visualisation for many hours, the image may be burned into the screen.

► Operate the device with changing visualisations!

2.3 Start-up behaviour of the controller

6827
15233
11575

⚠ WARNING

Danger due to unintentional and dangerous start of machine or plant sections!

► When creating the program, the programmer must ensure that no unintentional and dangerous start of machines or plant sections after a fault (e.g. e-stop) and the following fault elimination can occur!
⇨ Realise restart inhibit.

► In case of an error, set the outputs concerned to FALSE in the program!

A restart can, for example, be caused by:
- voltage restoration after power failure
- reset after watchdog response because of too long a cycle time
- error elimination after an E-stop

To ensure a safe behaviour of the controller:

► Monitor the voltage supply in the application program.

► In case of an error switch off all relevant outputs in the application program.

► Monitor actuators which can cause hazardous movements in the application program (feedback).

► Monitor relay contacts which can cause hazardous movements in the application program (feedback).

► If necessary, ensure that welded relay contacts in the application project cannot trigger or continue hazardous movements.

3 System requirements

Contents

Hardware 14
Software....14
Licensing....14

16903

© ifm electronic gmbh www.ifm.com

3.1 Hardware

11484

- Device of the product family dialogue module PDM360 NG CR1200
  - Hardware version: CR1200: AA
  - Runtime system: V3.2.0.1
- PC/laptop for the programming system CODESYS (→ system requirements CODESYS Development System V3.5)
- Ethernet connection between CODESYS PC/laptop and Ethernet interface of the CR1200 (→ installation instructions)

3.2 Software

13915

The following software components are required to program the device-internal PLC of the CR1200:

Component	Description	Version
CODESYS Development System	Programming software CODESYS for PLC programming complying with the standard IEC 61131-3	3.5 SP9 patch 4
Package CODESYS for ifm PDM360NG Products	▪ Device and interface description of CR1200 ▪ Function libraries for the programming of the device	1.6.2.0

The features and functions warranted in this manual can only be obtained by using the software components in the versions stated here.

On its website ifm electronic provides the software components for download:
→ www.ifm.com > Service > Download > [Systems for mobile machines]

3.3 Licensing

11511

By buying a dialogue module PDM360 NG CR1200 the buyer also purchases a licence valid for using the programming system CODESYS 3.5.

4.1 CODESYS programming software

7282

The CODESYS Development System (short: CODESYS) serves as platform for the creation of PLC applications according to the standard IEC 61131-3.

4.1.1 Install CODESYS Development System

18596

To install the software "CODESYS Development System":

► Install the programming system CODESYS 3.5 SP9 patch 4.
→ CODESYS installation and first steps

> CODESYS 3.5 SP9 patch 4 is installed on the programming PC/laptop.

© ifm electronic gmbh www.ifm.com

4.2 ifm package for PDM360 NG

Contents

Components of the package....18
Install ifm package....18
Update ifm package....19
Uninstall ifm package....19

9888

► Familiarise yourself with the following CODESYS functions!
- Package manager
  → Online help > CODESYS Development System > Manage packages and licenses

© ifm electronic gmbh www.ifm.com

4.2.1 Components of the package

9889

ifm provides the CODESYS package CODESYS for ifm PDM360NG Products for the programming of the device-internal PLC. The package contains the following components:

- Device description files
- ifm function libraries and extensions
- EDS files for various ifm devices

Detailed information about the ifm function libraries: → **ifm function libraries** (→ p. 145)

4.2.2 Install ifm package

7341

To install the ifm package CODESYS for ifm PDM360NG Products:

Prerequisites

> CODESYS 3.5 SP9 patch 4 is installed on the PC/laptop.

> ifm package CODESYS for ifm PDM360NG Products is stored on the PC/laptop.

1 Start CODESYS

► Start CODESYS.

> CODESYS user interface appears.

2 Start package manager

► Select [Tools] > [Package Manager] to start the Package Manager.

> Package manager appears.

> Window shows installed packages.

3 Install ifm package

► Activate [Install...].

> The file explorer appears.

► Select file `ifm_PDM360NG_V1_6_2_0.package` and carry out a complete installation.

> Window [Package Manager] shows installed ifm package.

► Activate [Close] to close the Package Manager.

► Save the project.

© ifm electronic gmbh www.ifm.com

4.2.3 Update ifm package

15219

To update the ifm package CODESYS for ifm PDM360NG Products:

1 Uninstall the old version of the ifm package

► **Uninstall ifm package** (→ p. 19)

2 Install the new version of the ifm package

► **Install ifm package** (→ p. 18)

3 Update device

► In the device tree: Mark node [Device (CR1200)].
► Select [Project] > [Update device].
> Dialogue window appears.
► Activate [Update device] to start the updating process.
> CODESYS loads new device libraries.
> Device tree view is updated.
► Activate [Close] to close the Package Manager.
► Save the project.

4.2.4 Uninstall ifm package

15022

To uninstall the ifm package CODESYS for ifm PDM360NG Products:

1 Start package manager

► Select [Tools] > [Package Manager] to start the Package Manager.
> Window [Package Manager] shows installed packages.

2 Uninstall ifm package

► Activate checkbox [Display versions].
> The window shows the version numbers of the installed packages.
► Select the package version to be uninstalled and uninstall it with [Uninstall...].
> Selected package version is uninstalled.
► Activate [Close] to close the Package Manager.

4.3 Update the runtime system of the device

Contents

Notes 21
Enter the recovery mode 22
Update the runtime system....22
Configure IP parameter of ethernet interface 25
Quit the recovery mode 27

18159

© ifm electronic gmbh www.ifm.com

4.3.1 Notes

18162

To update the runtime system the device needs to be in recovery mode.

Download the update file

18165

The user can download the current version of the runtime system from the ifm website.

► Access the download from the ifm website.
(→ www.ifm.com > Select your country > [Service] > [Download] > [Systems for mobile machines])

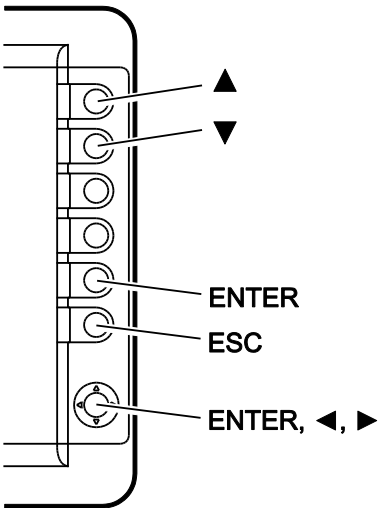

► Download the ZIP archive with the update file and unzip.

> The update file is stored on the PC/laptop (file `*.ifm`).

Key assignment in recovery mode

18163

In the recovery mode, the following key assignment applies:

Components of the runtime system

11649

During the update process the following software compknents of the device will be updated:

1. System software (Linux)
2. Firmware of the keys
3. Firmware of the I/O co-processor
4. Firmware of the watchdog co-processor

© ifm electronic gmbh www.ifm.com

4.3.2 Enter the recovery mode

19325

► Switch off the device (disconnect device from the mains).
► **Simultaneously** process the following actions:
  ▪ Press and keep pressed any 3 keys on the device simultaneously.
  ▪ Switch on the device.
    To do so, pin 15 and pin 30 must be connected with plus.
> The device is booting.
► Keep the keys pressed until the splash screen appears.
> The ifm recovery screen appears and displays IP configuration of the device's ethernet interface (IP address, subnet mask and gateway address).
> The device is in recovery mode.

4.3.3 Update the runtime system

18161

NOTICE

Risk of data loss!

Interrupting the update process can result in a loss of the user data stored in the device.

► Do not interrupt the update process!

The runtime system of the device can only be updated in the recovery mode.

The current version of the runtime system can be downloaded from the ifm electronic website (→ **Download the update file** (→ p. 21)).

► Select one of the following options:
  ▪ **Runtime system update via USB memory device** (→ p. 23)
  ▪ **Runtime system update via web browser** (→ p. 23)

© ifm electronic gmbh www.ifm.com

Runtime system update via USB memory device

9382

1 Download current release of runtime system

► Download new release of runtime system from the ifm website (→ **Download the update file** (→ p. 21)).

► Unzip the archive and copy the update file into the root directory of the USB memory.

Only ONE update file is allowed in root directory.

2 Connect the USB memory with the device

► Connect the USB memory with the device (→ installation instructions).

3 Enter the recovery mode

► **Enter the recovery mode** (→ p. 22)

4 Install the runtime system

► Use [▲] / [▼] to select the [Install from USB] button.

► Press [ENTER] to start the update process.

> Software components of the device are updated (→ **Notes** (→ p. 21)).

If successful:

> Status message appears: `Software update successful`.

The upgrade process may take a few minutes. Do not press any key on the device during the upgrade process!

5 Reboot the device neu starten

► Use [▲] / [▼] to select the [Reboot] button.

► Press [ENTER] to reboot the device.

> The device reboots.

© ifm electronic gmbh www.ifm.com

Runtime system update via web browser

9379

1 Neues Laufzeitsystem herunterladen

► Download new release of runtime system from the ifm website (→ **Download the update file** (→ p. 21)).

2 Enter the recovery mode

► **Enter the recovery mode** (→ p. 22)

3 Connect the device with the PC/laptop

► Establish an Ethernet network connection between the device and the PC/laptop (→ installation instructions).

► Optional: Set the IP configuration of the ethernet interface of the PC/laptop to match the IP configuration of the device.

4 Acitvate the web interface of the device

► Start the web browser on the PC/laptop.

► Enter the IP address of the device in the address line of the browser and press [ENTER] to activate the web interface (IP-Adresse: → Schritt 2).

> Browser shows web interface of the device.

> Web interface shows content of [Software Upgrade] tab.

5 Install the runtime system

► Press the [Select...] button.

> Windows explorer appears.

► Select update file (`Vxx.yy.zz_PDM360NG.ifm`) and press [Open] to proceed.

> [Select image to upload] field shows directory path and file name of the selected update file.

► Press [Send] button to start the update process.

> Software components of the device are updated (→ **Notes** (→ p. 21)).

> Web interface and device display show status messages.

If successful:

> Status message appears: `Software update successful.`

The upgrade process may take a few minutes. Do not press any key on the device during the upgrade process!

6 Reboot the device neu starten

► Use [▲] / [▼] to select the [Reboot] button.

► Press [ENTER] to reboot the device.

> The device reboots.

© ifm electronic gmbh www.ifm.com

4.3.4 Configure IP parameter of ethernet interface

11915

In order to update the runtime system of the CR1200 via a network infrastructure, the device's ethernet interface needs to be configured. The device provides the following options for configuration of the ethernet interface:

- Manual — The operator sets the interface parameters (IP address, subnet mask, gateway address) manually.
- Automatic — The interface parameters are set automatically by the network's DHCP server (DHCP = Dynamic Host Configuration Protocol).

To configure the IP parameter of the ethernet interface:

► Select one of the following options:
- **Synchronize the IP parameters with DHCP sever** (→ p. 25)
- **Configure the IP parameter manually** (→ p. 26)

Synchronize the IP parameters with DHCP sever

13375

1 Connect device with IP network

► Connect ethernet interface of the device with the IP network.

2 Select menu page

► Enter the Recovery mode (→ **Enter the recovery mode** (→ p. 22)).

► Use [▲] / [▼] to select the [Network Setup] menu and press [ENTER].

> Menu page displays available configuration options and current values of the IP parameters ([IP-address], [netmask], [gateway])

3 Set IP parameters

► Use [▲] / [▼] to select the [DHCP] menu item and press [ENTER].

> Device tries to obtain the IP parameters of the ethernet interface from the DHCP server of the network.

If successful:

> [Network Setup] menu page appears.

> Information bar shows active values of the IP parameters [IP-address], [netmask] und [gateway].

> Device can be accessed via the IP network by using the shown parameters.

If not successful:

> Error message is displayed.

► Press [ESC] to return to the [Network Setup] menu page.

► Remove the error cause and repeat the procedure.

© ifm electronic gmbh www.ifm.com

Configure the IP parameter manually

8906

Detailed information about the assignment of IP addresses in Ethernet networks: → **Address assignment in Ethernet networks** (→ p. 144).

1 Select menu page

► Enter the Recovery mode (→ **Enter the recovery mode** (→ p. 22)).
► Use [▲] / [▼] to select the [Network Setup] menu and press [ENTER].
> Menu page displays available configuration options and current values of the IP parameters ([IP-address], [netmask], [gateway])
► Use [▲] / [▼] to select the [Manual Setup] menu item and press [ENTER].
► Menu page displays options for manually setting of the IP parameters of the ethernet interface.

2 Set IP address

► Use [▲] / [▼] to select the [IP Address] menu item and press [ENTER].
> Menu page displays [IP address] input boxes.
> Right input box is in edit mode (dark-grey background).
► Use [▲] / [▼] to increment /decrement the number in the input box until the required value is set.
> Input box displays the new value.
► Use [◀] / [▶] to select the next input box and use [▲] / [▼] to enter the required number.
► Repeat the procedure until the required IP adress is set.
► Press [OK] to apply the new values and to return to the previous menu page.
OR
Press [ESC] to cancel to input procedure, to keep the old values and to return to the previous menu page.

3 Set subnetmask and gateway addess

► Repeat step 1 to set [Network Mask] and [Default Gateway].

4 Apply new values

► Use [▲] / [▼] to select [Apply] menu item and press [ENTER].
> New values are applied.
► Press [ESC] to return to the [Network Setup] menu page.
> Information bar displays current values of the interface parameters [IP-address], [netmask] und [gateway].

4.3.5 Quit the recovery mode

082

► Select ifm recovery screen.
► Use [▲] / [▼] to select the menu item [Reboot] and press [ENTER] to activate it.
► The device reboots.

If there is a valid project stored on the device, this project will be startet automatically after completing the reboot process.
If there is no valid project stored on the device, the CR1200 automatically enters the setup mode after completing the reboot process.

5.1 Enter the setup mode

18152

If no valid application is stored in the device, the device passes automatically in the setup mode after power on.

► Disconnect the device from power supply.
► Perform the following actions simultaneously:
  ▪ Press any 2 keys **simultaneously** and keep them pressed.
  ▪ Switch on the device.
► Keep both keys pressed until the setup menu appears.
> Device boots and passes into the setup mode.
> The start screen of the setup mode appears.

► Select one of the following submenus:

Submenu	Description
[SETUP]	Start setup menu (→ **Setup: start screen** (→ p. 40))
[PDF-VIEWER]	Start the PDF file viewer (→ **PDF file viewer** (→ p. 64))
[LOAD APPLICATION]	Load and start the PLC application (→ **Setup: Start the application** (→ p. 69))

5.2 Operating instructions

Contents

Key functionality 32
Navigation key 37
Setup: Working with enabled password protection 38

18108

In setup mode, the following rules apply:

© ifm electronic gmbh

5.2.1 Key functionality

18155

The assignment of the function keys is context sensitive. The function of a key is described by the text label of the corresponding button on the screen.

Only active function keys have a labeled button.

Only active function keys are backlit by the key LED.

The following table provides an overview of the available key functions:

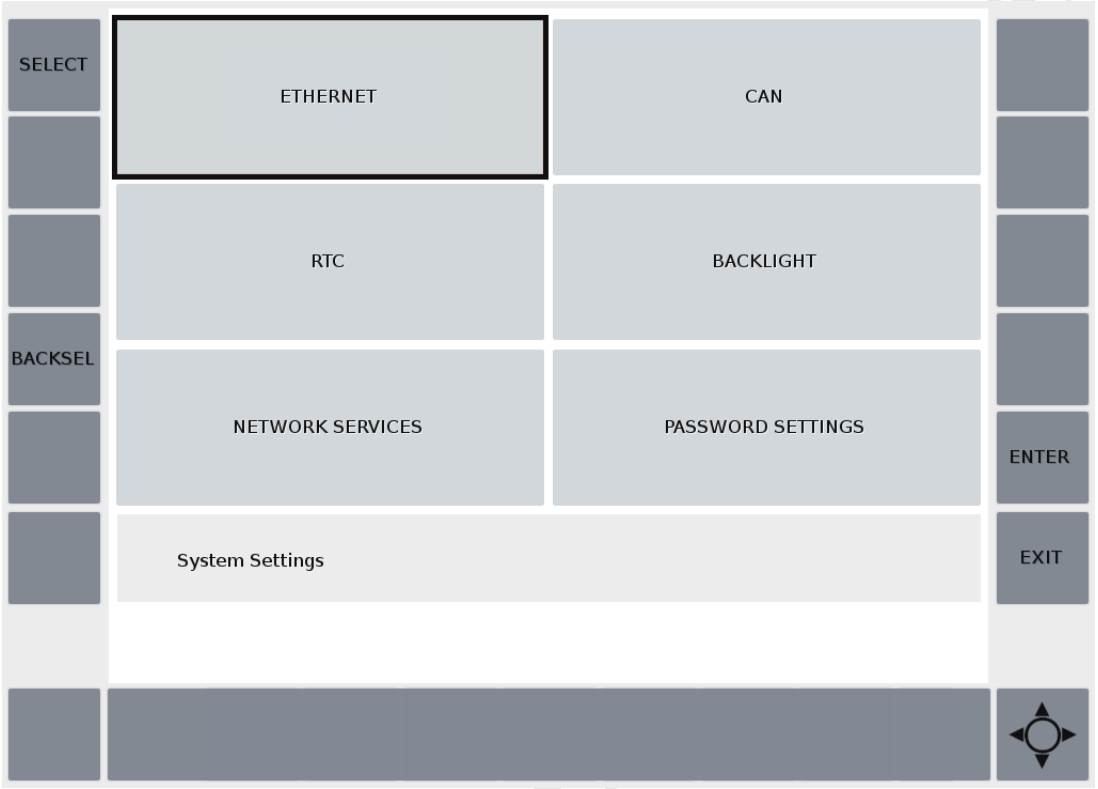

Button	Description	Example
[SELECT]	Select next GUI element	Select next menu item
[BACKSEL]	Select previous GUI element	Select previous menu item
[ENTER]	Activate function of the selected GUI element	Change to selected menu Show content of the selected directory
[EXIT]	Change to upper menu level	Leave current menu page and change to upper menu level
[LOAD]	Load selected GUI element	Load font file in the device memory
[RELOAD]	Update	Update view of current directory
[SAVE]	Save selected file or configuration	Save IP address
[START]	Start process	Start receiving CAN frames
[STOP]	Stop process	Stop receiving CAN frames
[▲], [▼], [◀], [▶]	▪ move to direction ▪ Increment/decrement value in selected number field	Select character of on-screen keyboard

© ifm electronic gmbh www.ifm.com

Operation: Navigate in the setup menu

14674

To navigate in the setup menu:

► Use [SELECT] to select the next menu item (forward).
OR:
Use [BACKSEL] tot select the previous menu item (backward).

> The selected menu item has a black frame.

► Use [ENTER] to change to the selected menu page.
OR:
Use [EXIT] to change to the higher-level menu.

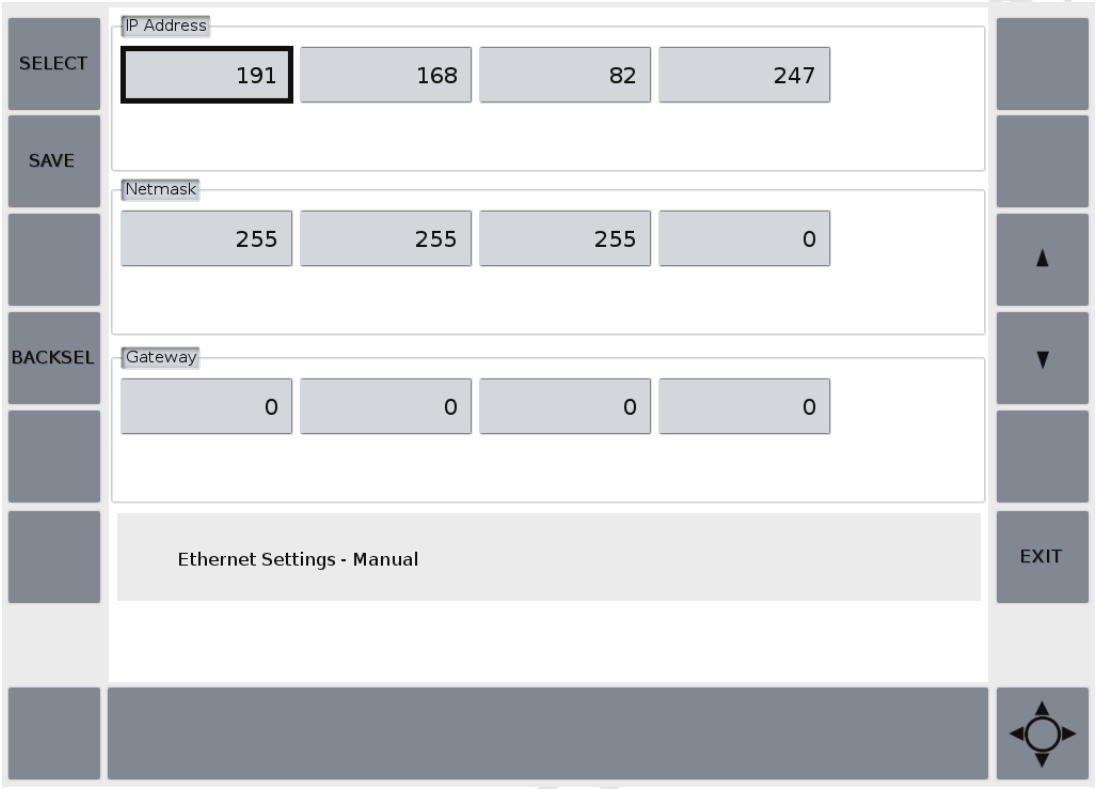

> The information field shows information about the current menu page (i.e. `System settings`).

© ifm electronic gmbh

Operation: Navigate within a menu screen

14675

To navigate within a menu page:

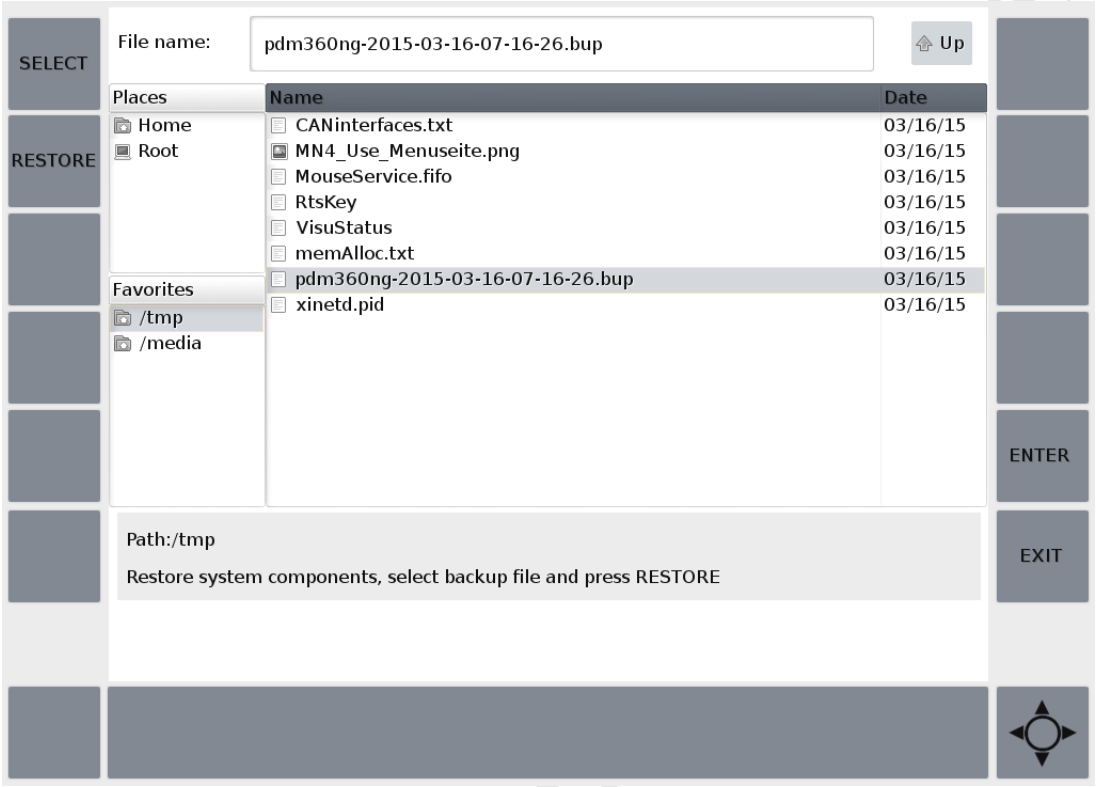

► Use [SELECT] or [BACKSEL] to select the requested GUI element (i.e. number field, option field).
> The selected GUI element has a black frame.
> The selected GUI element is activated and can be changed.
► Use [ENTER] to activate / deactivate the selected GUI element (i.e. option field)
OR:
Use [▲]/[▼] to increment/decrement the value of the selected GUI element (i.e. number field).
> The changes are displayed.
► Use [SAVE] to confirm and apply the changes.
► Use [EXIT] to change to the higher-level menu.

© ifm electronic gmbh

Operation: Navigate in the file directory

14673

To navigate in the file directory:

► Use [SELECT] to select a specific window (i.e. [Name], [Places], [Favorites] and [UP])
> The selected window is focused (black frame or dark-grey header).
► Use [▲]/[▼] to select an specific item within the selected window (i.e. file, directory).
> The selected item has a light-grey background.
► Use [ENTER] to change into the selected directory.
OR
Start action according to key label (i.e. Use [RESTORE] to restore the data saved in the selected backup file).
> Selected action is proceeded.
> Use [EXIT] to change to the higher-level menu.

© ifm electronic gmbh

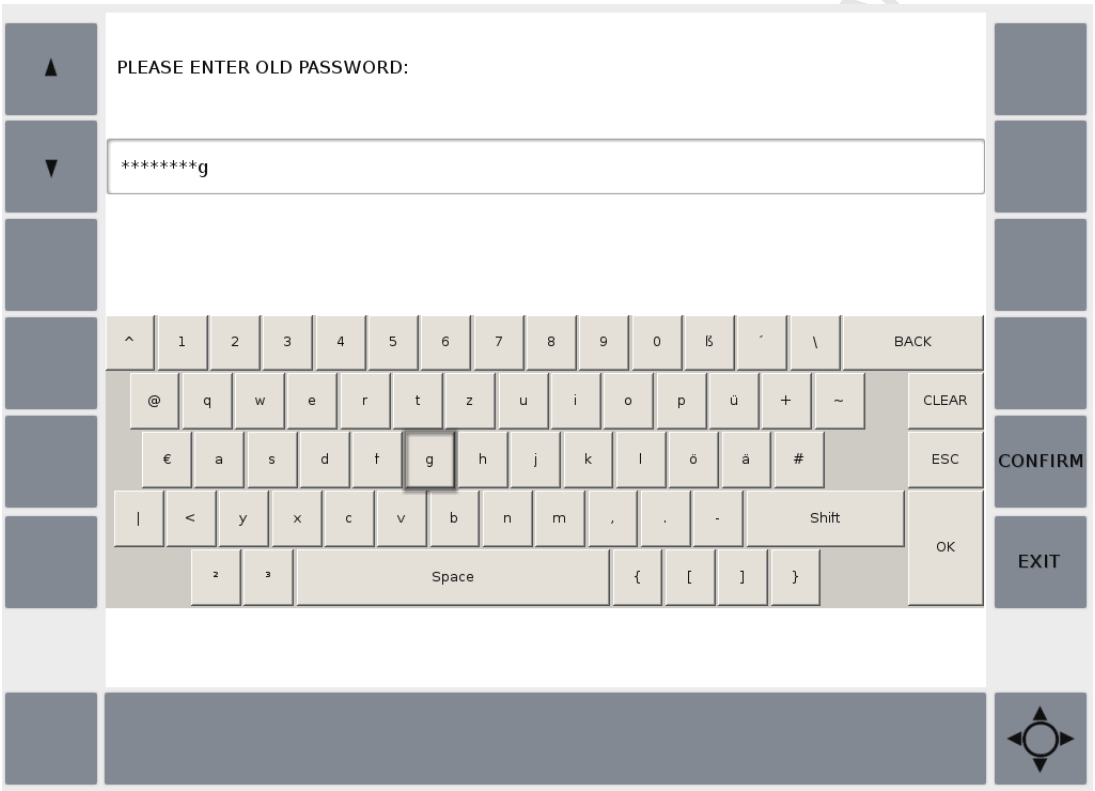

Operation: Enter a text using the on-screen keyboard

11763

The user interface of the runtime system has an on-screen keyboard. It appears automatically as soon as the user is expected to enter characters.

The on-screen keyboard shows the German character set (QWERTZ keyboard layout).
To protect sensitive information only the character entered last appears in plain text. All other characters are replaced by an *.

To enter a text:

► Use [▲] / [▼] and [▶] / [◀] to select the button of the requested character.
> The selected button is highlighted (black frame).
► Use [ENTER] to activate the selected button.
> The entered character appears in the input box.
► Repeat the process for all requested characters.
► Use [CONFIRM PASSWD] to confirm the entry
OR:
Use [EXIT] to cancel and return to the previous setup screen .

© ifm electronic www.ifm.com

5.2.2 Navigation key

18158

The navigation key consists of the following single keys:

- 4 direction keys (▼, ▲, ◀, ▶)
- 1 function key (center key)

The keys of the navigation key can be used as an alternative as well as an equivalent to function keys. The following table shows operating elements with the same function:

Navigation key	Function key	Function
	[▲]	Move up
	[◀]	Move left
	[BACKSEL]	Select previous menu item
	[▶]	Move right
	[SELECT]	Select next menu item
	[▼]	Move down
	[ENTER]	Activate menu item / button

© ifm electronic gmbh www.ifm.com

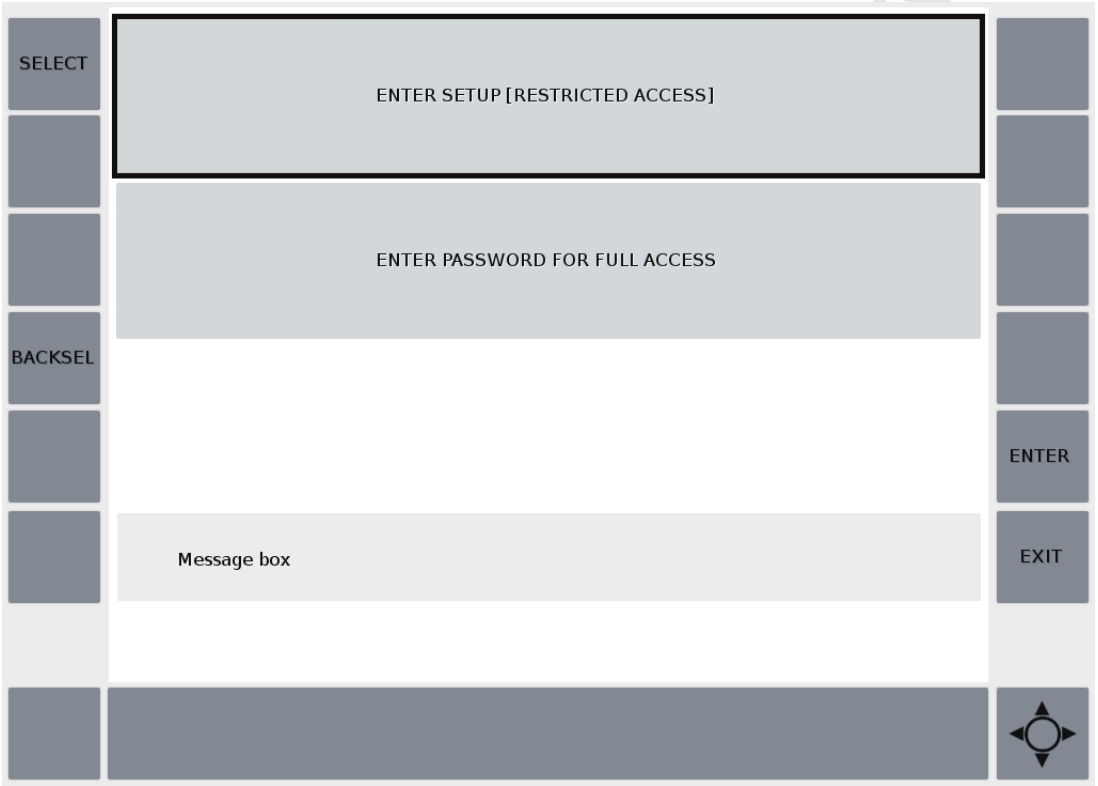

5.2.3 Setup: Working with enabled password protection

11914

If the password protection is enabled, the operator has only accress to the following menu functions:

- [SETUP] > [System Information]
- [SETUP] > [ACTIONS] > [Keyboard Test]

All other menu functions are disabled.
Additionally, after changing to the setup menu the display shows the following setup start screen:

Select one of the following options:

- **Setup: Setup menu with restricted access rights** (→ p. 39)
- **Setup: Enter the password for full access to the setup menu** (→ p. 39)

© ifm electronic www.ifm.com

Setup: Setup menu with restricted access rights

11729

Protected setup functions have the following characteristics:

- They are disabled in all setup submenus (greyed out).
- They cannot be selected with [SELECT] / [BACKSEL].

To call the setup menu with restricted access rights:

1 Select menu page

► Navigation path: [SETUP] > [ENTER SETUP [RESTRICTED ACCESS]]

> The setup menu appears

> Disabled functions are greyed out.

2 Select menu item

► Use [SELECT] / [BACKSEL] to select the requested menu item .

> The selected menu item has a black frame.

► Use [ENTER] to change to the selected setup screen.
OR:
Use [EXIT] return to the previous setup screen.

Setup: Enter the password for full access to the setup menu

11759

To enter the password to have full access to the setup menu:

1 Select menu page

► Navigation path: [SETUP] > [ENTER PASSWORD FOR FULL ACCESS]

> Display shows on-screen keyboard for entering the password.

2 Enter passwort

► Enter the correct password (→ **Operation: Enter a text using the on-screen keyboard** (→ p. 36)).

► Use [CONFIRM PASSWD] to confirm the entry
OR:
Use [EXIT] to cancel and return to the previous setup screen .

> The setup menu appears.

> Information bar displays a confirmation message.

> All setup functions can be selected without any restriction.

Full access to all setup function is only valid until the user exits the setup menu.

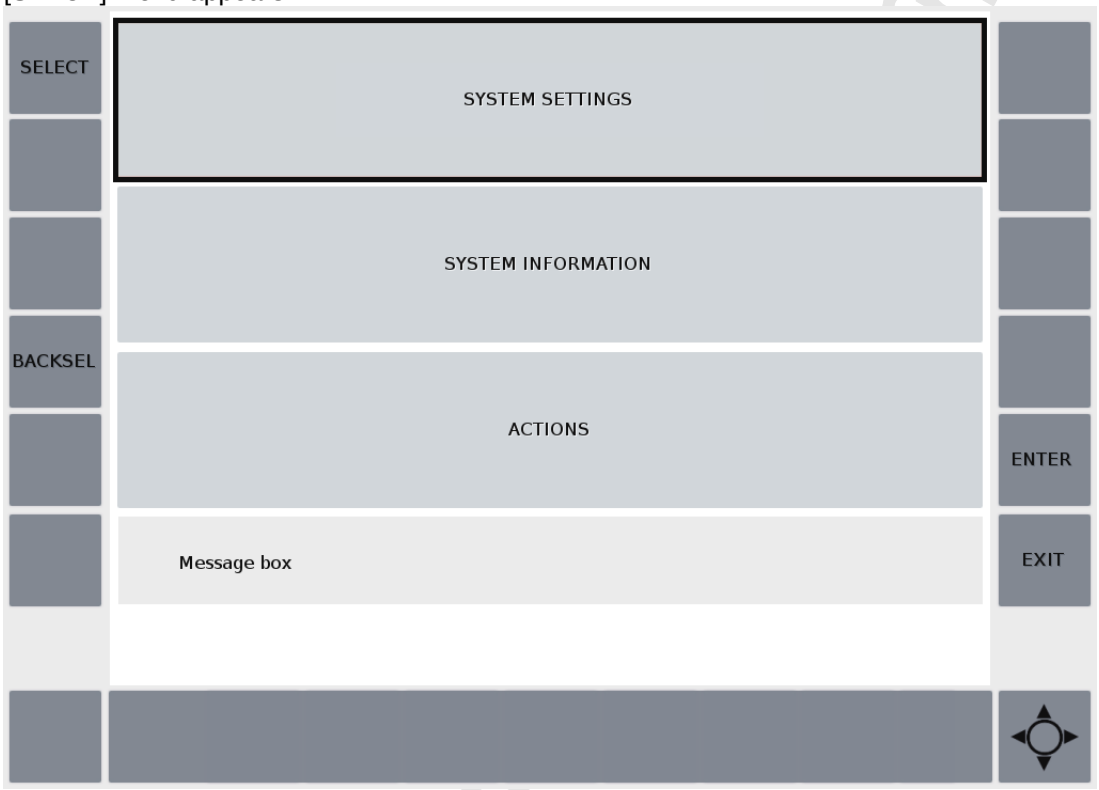

► When the setup menu is called, enter the password again!

© ifm electronic gmbh www.ifm.com

5.3 Setup: start screen

14556

► Select [SETUP] and press [ENTER].
> [SETUP] menu appears:

► Select one of the following menu items:

Name	Description
[SYSTEM SETTINGS]	Access system settings (→ **Setup: System settings** (→ p. 41))
[SYSTEM INFORMATION]:	Display system information: (→ **Setup: Display system information** (→ p. 50))
[ACTIONS]	Access additional functions (→ **Setup: More functions** (→ p. 51))

Consider notes regarding the work with enabled password protection!
→ **Setup: Working with enabled password protection** (→ p. 38)

© ifm electronic gmbh

5.3.1 Setup: System settings

9603

The menu [SETUP] > [SYSTEM SETTINGS] provides access to the following functions:

Menu item	Function
[ETHERNET]	→ **Setup: Configure the IP parameters manually** (→ p. 42)
[CAN]	→ **Setup: Set the CAN interfaces** (→ p. 44)
[RTC]	→ **Setup: Set the real-time clock (RTC)** (→ p. 45)
[BACKLIGHT]	→ **Setup: Set the display brightness** (→ p. 46)
[NETWORK SERVICES]	→ **Setup: Set the network services** (→ p. 47)
[PASSWORD SETTINGS]	→ **Setup: Set the password protection** (→ p. 48)

Setup: Configure the Ethernet interface

13857

The device provides the following options for configuration of the Ethernet interface:

- Manual — The operator sets the interface parameters (IP address, subnet mask, gateway address) manually.
- Automatic — The interface parameters are set automatically by the network's DHCP server (DHCP = Dynamic Host Configuration Protocol).

To configure the IP parameter of the ethernet interface:

► Select one of the following options:
  - **Synchronize the IP parameters with DHCP sever** (→ p. 25)
  - **Configure the IP parameter manually** (→ p. 26)

© ifm electronic gmbh www.ifm.com

Setup: Configure the IP parameters manually

7408

- IP address (factory settings) = 192.168.82.247
- Login data to access the device via Telnet/SSH and FTP/SCP:
  USERNAME = root
  PASSWORD = pdm360ng
- Further information regarding the address assignment in Ethernet networks:
  → **Address assignment in Ethernet networks** (→ p. 144).

To set the IP parameters of the Ethernet interface manually:

1 Select menu page

► Navigation path: [SETUP] > [SYSTEM SETTINGS] > [ETHERNET] > [MANUAL]

> Menu page displays the following information:

Name	Description	Possible values
[IP Address]	IP address of the Ethernet interaface of the device	i.e. `192.68.82.247`
[Netmask]	Subnetmask of the network segment	i.e. `255.255.255.0`
[Gateway]	IP address of the network gateway	i.e. `192.168.82.1`

2 Set IP parameters

► Use [SELECT] / [BACKSEL] to select the required number field.

► Use [▲] / [▼] to increment / decrement the number in the selected number field until the requested value has been reached.

> Number field shows the required value.

► Optional: Repeat the procedure until the values in all number fields are correctly set.

3 Save changed values

► Press [SAVE] to confirm and save the changed values.

© ifm electronic gmbh www.ifm.com

Setup: Configure the IP parameters automatically

13791

To use DHCP, the device must be connected to a DHCP server via the Ethernet interface.

To set the IP parameters of the Ethernet interface by means of the Dynamic Host Configuration Protocol (DHCP).

1 Select menu page

► Navigation path: [SETUP] > [SYSTEM SETTINGS] > [ETHERNET] > [DHCP]

> Menu page displays the following information:

Bezeichung	Bedeutung	Mögliche Werte	
[DHCP Client]	Status of DHCP client of the device	☐	DHCP client disabled
		☑	DHCP client enabled
[IP Address]	IP address of the Ethernet interface of the device	i.e. `192.68.82.247`	
[Netmask]	Subnetmask of the network segment	i.e. `255.255.255.0`	
[Gateway]	IP address of the network gateway	i.e. `192.68.82.1`	

2 Enable DHCP client of the device

► Press [ENTER] to enable the [DHCP Client] checkbox.

> The DHCP client tries to obtain valid IP parameters from the DHCP server.

> Status message appears: `Trying to get DHCP lease...`

If successful:

> [IP Address], [Netmask] and [Gateway] show valid values assigned by the DHCP server.

> Status message appears: `DHCP configured successfully`

If not successful:

> Status message appears: `Failed to get DHCP lease!`

► Use [EXIT] to stop the configuration process.

► Check the connection to the DHCP server!

► Repeat the configuration process (s.a.).

© ifm electronic gmbh www.ifm.com

Setup: Set the CAN interfaces

7413

To set the parameters of the CAN interfaces:

1 Select menu page

► Navigation path: [SETUP] > [SYSTEM SETTINGS] > [CAN]

> Menu page displays the following informations:

Name	Description
[CAN Bus 1]	Settings of of CAN interace 1
[CAN Bus 2]	Settings of of CAN interface 2
[CAN Bus 3]	Settings of of CAN interface 3
[CAN Bus 4] *	Settings of of CAN interface 4

* ... only available at devices with 4 CAN interfaces

2 Select CAN interface

► Use [SELECT] / [BACKSEL] to select the requested CAN interface.

► Press [ENTER] to change to the selected menu page.

> Menu page displays the following informations:

Name	Description	Possible values
[Baudrate CAN Bus x] *	Baudrate of the selected CAN interface	0 kBit/s 20 kBit/s 50 kBit/s 100 kBit/s 125 kBit/s 250 kBit/s 500 kBit/s 800 kBit/s 1 MBit/s

* ... x = ID of the selected CAN interface

3 Change baudrate of the CAN interface

► Press [ENTER] to change to the selected menu page.

> Menu page displays the current baudrate of the selected CAN interface.

► Use [▲] / [▼] to set the required value.

► Press [SAVE] to confirm and save the changed values.

► Press [EXIT] to return to the upper next menu level.

> Optional: Repeat steps 2 and 3 to set the values of additional CAN interfaces.

© ifm electronic gmbh www.ifm.com

Setup: Set the real-time clock (RTC)

7414

To set the real-time clock.

1 Select menu page

► Navigation path: [SETUP] > [SYSTEM SETTINGS] > [RTC]

> Menu page displays the following informations:

Name	Description	Possible values
[YYYY]	Year	2000 ... 2100
[MM]	Month	1 ... 12
[DD]	Day	1 ... 31
[hh]	Hour	0 ... 23
[mm]	Minute	0 ... 59
[ss]	Second	0 ... 59

2 Change date and time of the real-time clock (RTC)

► Use [SELECT] / [BACKSEL] to select the required number field.

> Selected number field has focus (black frame).

► Use [▲] / [▼] to set the required value.

► Optional: Repeat step 2 to set the values of additional number fields.

3 Save changed values

► Press [SAVE] to confirm and save the changed values.

> Information bar displays acknowledge message.

► Press [EXIT] to return to the upper next menu level.

© ifm electronic gmbh www.ifm.com

Setup: Set the display brightness

7405

The setup menu is always displayed with a 100 % brightness. The changed brightness will only become effective outside the setup menu.

So set the display brightness:

1 Select menu page

► Navigationspfad: [SETUP] > [SYSTEM SETTINGS] > [BACKLIGHT]

> Men u page displays the following informations:

Name	Description	Possible values	
[Brightness in %]	Relative brightness of the display (values at %)	0 ... 100	minimal brightness maximal brightness

2 Set brightness level of display

► Use [▲] / [▼] to set the required value.

► Press and keep pressed the [TEST] button to test the set value.

3 Save the new value

► Press [SAVE] to confirm and save the changed values.

> Information bar displays acknowledge message.

► Press [EXIT] to return to the upper next menu level.

© ifm electronic gmbh www.ifm.com

Setup: Set the network services

11719

The secure network services Secure Shell (SSH) and Secure Copy (SCP) are always available. The user can therefore access the device via SSH and SCP if the network services Telnet and FTP are inactive.
(→ **Access the device with SSH**, → **Copy the files with SCP**).

To set the Telnet and FTP network services.

1 Select menu page

► Navigation path: [SETUP] > [SYSTEM SETTINGS] > [NETWORK SERVICES]

► Menu page displays the following informations:

Name	Description	Possible values	
[Telnet]	Enable / Disable the Telnet service of the device	☑	Telnet enabled
		☐	Telnet disabled
[FTP]	Enable / Disable the FTP service of the device	☑	FTP enabled
		☐	FTP disabled

2 Enable / Disable Telnet service

► Use [SELECT] / [BACKSEL] to select the [Telnet] check box.

► Press [ENTER] to enable / disable the the Telnet service.

> Information bar displays status of the service:
[running] = Telnet service is enabled
[not running] = Telnet service is disabled

3 Enable / Disabled FTP service

► Use [SELECT] / [BACKSEL] to select the [FTP] check box.

► Press [ENTER] to enable / disable the the FTP service.

> Information bar displays status of the service:
[running] = FTP service is enabled
[not running] = FTP service is disabled

> Press [EXIT] to return to the upper next menu level.

© ifm electronic gmbh

Setup: Set the password protection

11720

The menu page [SETUP] > [SYSTEM SETTINGS] > [PASSWORD SETTINGS] provides access to the following options:

- **Setup: Change the system password** (→ p. 48)
- **Setup: Enable / Disable password protection** (→ p. 49)

Setup: Change the system password

11722

In case of a password loss a recovery update has to be processed.

► Update the runtime system of the device (→ **Update the runtime system of the device** (→ p. 20))

► If necessary, restore the saved data (→ **Restore: Restore the system files** (→ p. 60))

Notes on operation of the on-screen keyboard: → **Operation: Enter a text using the on-screen keyboard** (→ p. 36)

To change the system password.

1 Select menu page

► Navigationspfad: [SETUP] > [SYSTEM SETTINGS] > [PASSWORD SETTINGS] > [Change System Password]

> Menu page displays on-screen keyboard.

2 Enter the old password

► Enter the old password.

► Use [CONFIRM] to confirm the input.

Gibt der Anwender das falsche Passwort ein, erscheint folgende Fehlermeldung: `PASSWORD INCORRECT. PLEASE TRY AGAIN.`

► Eingabe des Passwort wiederholen!

3 Enter new password

► Enter new password.

► Use [CONFIRM] to confirm the entered password.

► Re-enter the new password and use [CONFIRM] to confirm the entered password.

> Information bar displays acknowledge message: `PASSWORD CHANGED`.

> New password is applied.

If the operator enters 2 different passwords the following error message appears: `PASSWORDS DON'T MATCH. PLEASE TRY AGAIN!`

► Re-enter the passwords correctly!

► Press [EXIT] to return to the upper next menu level.

© ifm electronic gmbh www.ifm.com

Setup: Enable / Disable password protection

11418

On delivery the password protection for the setup menu is deactivated.

If the password protection is activated after the first setup, the password set at the factory is valid: `pdm360ng`

► To ensure effective protection, change the default system password!

The programming software CODESYS can access the IEC project saved on the device even with activated password protection.

If the password protection is enabled the operator has restricted access to the functions of the setup menu (→ **Setup: Working with enabled password protection** (→ p. 38)).

To enable / disable the password protection of the device:

1 Select menu page

► Navigation path: [SETUP] > [SYSTEM SETTINGS] > [PASSWORD SETTINGS]

> Information bar displays status of the password protection:
[Setup Password is now enabled] = Password protection is enabled
[Setup Password is now disabled] = password protection is disabled

2 Set password protection

► Use [SELECT] / [BACKSEL] to select the [Enable Setup Password] / [Disable Setup Password] button.

► Use [ENTER] to press the button.

> Password protection is enabled / disabled.

> Infomation bar displays status of the password protection (→ step 1).

► Press [EXIT] to return to the upper next menu level.

The password protection does not become active before the next call of the setup menu.

► Use [EXIT] repeatedly to change to the startscreen of the setup mode.

► Use [ENTER] to enter the setup menu.

© ifm electronic gmbh www.ifm.com

5.3.2 Setup: Display system information

7407

To display the system information:

1 Select menu page

► Navigation path: [SETUP] > [SYSTEM INFORMATION]

> Menu page displays the following information:

Name	Description
[Serial Number]	Serial number of the device
[SW Version]	Software version
[FW Version WD]	Firmware version of the watch-dog component
[FW Version IO]	Firmware version of the I/O interface
[FW Version Keyboard1]	Firmware version of the keyboard 1
[FW Version Keyboard2]	Firmware version of the keyboard 2
[FW Version Keyboard3]	Firmware version of the keyboard 3
[MAC Address]	MAC address of the Ethernet interface
[Supply Voltage]	Value of the supply voltage
[Internal Voltages]	Internal voltage values
[System Temperatures]	Temperatures in the system
[Memory Alloc Sitze/Used]	Memory size / memory used

© ifm electronic gmbh www.ifm.com

5.3.3 Setup: More functions

7409

The submenu [SETUP] > [ACTIONS] provides access to the following functions:

Menu item	Function
[REBOOT]	→ **Setup: Reboot the device** (→ p. 52)
[CAN TEST]	→ **Setup: Test the CAN interfaces** (→ p. 52)
[SPLASH SCREEN]	→ **Setup: Define the splash screen** (→ p. 55)
[KEYBOARD TEST]	→ **Setup: Test input elements** (→ p. 56)
[BACKUP/RESTORE]	→ **Setup: Backup / Restore software components** (→ p. 57)
[USB REMOVE]	→ **Setup: Safely remove the USB device** (→ p. 61)
[FONTS]	→ **Setup: Manage fonts** (→ p. 62)
[FORMAT STORAGE]	→ **Setup: Format the internal storage** (→ p. 63)

© ifm electronic gmbh www.ifm.com

Setup: Reboot the device

7410

To reboot the device:

1 **Select menu page**
   ► Navigation path: [SETUP] > [ACTIONS] > [REBOOT]
   > [Reboot] menu page appears.
2 **Reboot the device**
   ► Press [ENTER] to reboot the device.
   > Device reboots.

If a valid project is loaded, this project is started after a reboot.
If no valid project is saved, the setup splash menu appears again after rebooting.

Setup: Test the CAN interfaces

7411

To test the CAN interfaces of the device, process one of the following functiions:

- **CAN test: Transmit data** (→ p. 53)
- **CAN test: Receive data** (→ p. 54)

© ifm electronic gmbh www.ifm.com

CAN test: Transmit data

9625

To test transmitting CAN messages:

1 Select menu page

► Navigation path: [SETUP] > [ACTIONS] > [CAN TEST]

> Menu page [CAN Bus Selection] appears.

2 Select CAN interface

► Use [SELECT] / [BACKSEL] to select the requested CAN interface and press [ENTER] to confirm.

> Menu page [CAN Test Selection] appears.

3 Set test message and sender ID

► Use [SELECT] / [BACKSEL] to select the [CAN Transmit Test, Bus x] button and press [ENTER] to confirm.

> Menu page displays the following information.

Name	Description	Possible values
[Tx Bytes (hex)]	CAN test message (8 bytes) Every byte can be set seperatly (hexadecimal number).	byte: 00 = 0 ... FF = 255
[CAN Tx-ID (hex)]	CAN-ID of the sender (hexadecimal number)	00000000 ... FFFFFFFF
[Tx Frame Counter]	Number of transmitted messages	

► Set the test CAN message to be sent in hex format in [Tx Bytes (hex)].

► Set the test CAN message to be sent in hex format in [Tx Bytes (hex)].

4 Transmit test message

► Press [START] to start the transmission.

> Device tries to send the test message on the selected CAN interface.

> The number of the CAN messages sent since the beginning of the transfer appears in [Tx Frame Counter].

If successful:

> Information bar displays confirmation message.

► Press [STOP] to finish the cyclic transmission of the test message.

If not successful:

> Information bar displays error message.

► Press [STOP] to finish the cyclic transmission of the test message.

► Check the CAN interface connection.

► Repeat the procedure.

If no baudrate of the CAN interface was set the test will be processed with 125 Kbits/s.

© ifm electronic gmbh www.ifm.com

CAN test: Receive data

9627

To test receiving CAN messages:

1 Select menu page

► Navigation path: [SETUP] > [ACTIONS] > [CAN TEST]

> [CAN Bus Selection] menu page appears.

2 Select CAN interface

► Use [SELECT] / [BACKSEL] to select the requested CAN interface and press [ENTER] to confirm.

> [CAN Test Selection] menu page appears.

3 Receive CAN message

► Use [SELECT] / [BACKSEL] to select the [CAN Receive Test, Bus x] button and press [ENTER] to confirm.

> Menu page displays the following informations:

Name	Description	Possible values
[Rx Bytes (hex)]	Received CAN message (8 bytes); Each byte containes a hexadecimal value.	byte: 00 = 0 ... FF = 255
[CAN Rx-ID (hex)]	CAN-ID of the receiver (hexadecimal value)	00000000 ... FFFFFFFF
[Rx Frame Counter]	Number of received messages	

► Press [START] to start receiving messages on the selected CAN interface. (→ note)

> [Rx Bytes (hex)] displays the content of the received messages (hexadecimal value).

> [CAN Rx-Id (hex)] displays CAN ID related to the revceived message (hexadecimal value).

> [Rx Frame Counter] displays the number of messages received sicne the start of the transmission.

If successful:

> [Rx Frame Counter] displays value > 0.

► Press [STOP] to finish receiving CAN messages.

If not successful:

> [Rx Frame Counter] displays value 0.

► Pres [STOP] to finish receiving CAN messages.

► Check the CAN interface connection.

► Repeat the procedure.

If no baudrate of the CAN interface was set the test will be processed with 125 Kbits/s.

© ifm electronic gmbh www.ifm.com

Setup: Define the splash screen

9629

Specifications for the image file, which is used as splash screen → **image properties** (→ p. 107)

To change the splash screen of the device:

1 Select menu page

► Navigation path: [SETUP] > [ACTIONS] > [SPLASH SCREEN]

2 Select source of image file

> Menu page displays the following options:

Name	Description
[Load from USB device]	Load the image file from a USB device
[Load from /tmp]	Load the image file from the directory `/tmp` of the device
[Load from ...]	Load the image file from a selectable directory

► Use [SELECT] / [BACKSEL] to select the requested menu item and press [ENTER] to confirm.

> Menu page displays the selected image source.

3 Set splash screen

► Select the requested image file.

> Selected image file has focus.

► Use [LOAD] to save the file in the device and to use the image as splash screen.

Specifications of the splash screen image

11643

The user can define a user-defined splash screen. The image file has the following restricitions:

Parameter	Restriction
File type	Bitmap (*.bmp) RLE compressed
File name	Naming convention = 8.3, only small characters
Resolution	1024 x 768 Pixel
Colours	262.144 (18 Bit)
File size	≤ 512 kByte

© ifm electronic gmbh www.ifm.com

Setup: Test input elements

13871

To test the function of the keys, the key LEDs and the navigation switch:

1 Select menu page

► Navigation path: [SETUP] > [ACTIONS] > [KEYBOARD TEST]

> [Keyboard Test] menu page appears.

2 Test function keys

► Press any function key and keep it pressed.

> The key-related area on the screen is displayed brighter.

> The key LED is off.

3 Test navigation switch

► Use [OK] or [◀] / [▶] to switch between the two input fields of the group [Navigation Switch Test].

> Selected field gets a black frame.

► Use [▲] / [▼] to increment / decrement the value displayed in the selected field.

© ifm electronic gmbh www.ifm.com

Setup: Backup / Restore software components

7412

To backup data stored on the device as well as to restore data to the device, the following options are available:

Name	Description
[BACKUP SYSTEM INFORMATION]	Save the system information (→ **Backup: Save the system information** (→ p. 57))
[BACKUP SYSTEM]	Save the system software (→ **Backup: Save the system files** (→ p. 58))
[RESTORE SYSTEM]	Restore the system software (→ **Restore: Restore the system files** (→ p. 60))

Backup: Save the system information

9648

Contents of the file → **Setup: Display system information** (→ p. 50).

To save the system information:

1 Select menu page

► Navigation path: [SETUP] > [ACTIONS] > [BACKUP/RESTORE]

> [System Backup & Restore] menu page appears.

► Select [BACKUP SYSTEM INFORMATION] and press [ENTER] to confirm.

2 Select memory location

> Menu page displays the following options:

Name	Description
[Save to USB device]	Save data to a USB device
[Save to /tmp]	Save data to the device directory `/tmp`
[Save to ...]	Save data to a selectable directory of the device

► Use [SELECT] / [BACKSEL] to select the requested menu item and press [ENTER] to confirm.

> Menu page displays the content of the selected memory location.

3 Save the system information

► Select requested directory.

► Press [SAVE] to save the system information.

> Devices saves the file containing the system information in the selected directory.

© ifm electronic gmbh

Backup: Save the system files

9637

⚠ WARNING

If the backup and the restore device have different runtime versions, the restoration of a backup file can lead to an undefinable system behaviour of the device!

The runtime versions on the backup and restore devices must be identical.

► Ensure that the runtime systems on the backup and restore device are of the same version! (→ **Update the runtime system of the device** (→ p. 20))

To save the system files to a selectable location:

1 Select menu page

► Navigation path: [SETUP] > [ACTIONS] > [BACKUP/RESTORE]

> [System Backup & Restore] menu page appears.

► Select [BACKUP SYSTEM] and press [ENTER] to confirm.

2 Select software components

> Menu page displays the following options:

Name	Description
[Select All]	Enable all software components
[Backup Ethernet Settings]	Settings of the Ethernet network adapter
[Backup Backlight Settings]	Settings of the background illumination
[Backup Splash Screen]	Splash screen
[Backup Retain Data]	Retain data
[Backup User Filesystem (/home)]	User file system
[Backup Internal Mass Storage (/data)]	Mass storage contents

► Use [SELECT] / [BACKSEL] to select the required components and press [ENTER] zu enable / disable.
☐ = Exclude software component from backup file
☑ = Include software component in backup file

► Optional: Repeat procedure for additional software components.

Check [Select All] to include all software components in the backup file.

► Press [CONFIRM] to confirm the selection.

3 Select memory location for backup file

> Menu page displays the following options:

Name	Description
[Save to USB device]	Save data to a USB device
[Save to /tmp]	Save data to directory `/tmp`
[Save to ...]	Save data to a selectable directory

► Use [SELECT] / [BACKSEL] to select the requested menu item and press [ENTER] to confirm.

> Menu page displays content of the selected memory location.

4 Save backup file

► Optional: Select required target directory.

► Press [SAVE] to save the selected system files in a backup file (`.bup`).

> Device saves backup file in selected directory.

► If required,press [ABORT] to cancel the backup process.

© ifm electronic gmbh www.ifm.com

Restore: Restore the system files

9636

⚠ WARNING

If the backup and the restore device have different runtime versions, the restoration of a backup file can lead to an undefinable system behaviour of the device!

The runtime versions on the backup and restore devices must be identical.

► Ensure that the runtime systems on the backup and restore device are of the same version! (→ **Update the runtime system of the device** (→ p. 20))

► Use the option "Auto Restore" for the automatic restoration of system files from a backup file (→ **Automatically restore system files** (→ p. 70)).

To restore the system files from a backup file (*.bup):

1 Select menu page

► Navigation path: [SETUP] > [ACTIONS] > [BACKUP/RESTORE]

> [System Backup & Restore] menu page appears.

► Select [RESTORE SYSTEM] and press [ENTER] to confirm.

2 Select backup file

► Menu page displays the following options:

Name	Description
[Restore from USB device]	Restore data from USB device
[Restore from /tmp]	Restore data from directory `/tmp`
[Restore from ...]	Restore data from a selectable directory

► Use [SELECT] / [BACKSEL] to select the memory location of the backup file and press [ENTER] to confirm.

> Menu page displays content of selected memory location.

► Select backup file.

► Press [RESTORE] to load the selected backup file.

3 Select software components

> Menu page displays list of software components included in the backup file.

Software components not included in the backup file are geyed out!

► Use [SELECT] / [BACKSEL] to select the software components to be restored and press [ENTER] to check / uncheck the option field:
☐ = Exclude software component from restoring process
☑ = Include software component in restoring process

► Optional: Repeat procedure for additional software components.

► Press [CONFIRM] to confirm the selection.

> Device restores the selected software components.

> Status bar displays progess of restoring process.

► If required, press [EXIT] to cancel the restoring process.

Setup: Safely remove the USB device

9631

NOTICE

Risk of data loss on the USB device!

► Unmount USB devices before removing them from the runtime system!

► Do not remove the USB device before unmounting has been confirmed!

To safely remove a USB device:

1 Select menu page

► Navigation path: [SETUP] > [ACTIONS] > [USB REMOVE]

2 Remove the USB device from runtime system

> Menu page displays directory `/media` containing all mounted USB devices (grey background).

► Use [▲] / [▼] to select the requested USB device.

► Press [REMOVE] to unmount the selected USB device from the file system.

> USB device is unmounted.

> Informaation bar displays confirmation message.

> Operator can safetly disconnect the USB device from the system.

© ifm electronic gmbh www.ifm.com

Setup: Manage fonts

14372

To manage font files (True Type Fonts) on the device, the following options are available:

Name	Description
[LOAD FONT]	Install font files on the device (→ **Fonts: Load the font** (→ p. 62))
[REMOVE FONT]	Remove font files stored on the device (→ **Fonts: Remove the font** (→ p. 62))

Fonts: Load the font

13866

To install a font file (true type fonts) on the device:

1 Select menu page

► Navigation path: [SETUP] > [ACTIONS] > [FONTS] > [LOAD FONT]

2 Select source of the font file

> Menu page displays the following options:

Name	Description
[Load from USB device]	Load font file from USB device
[Load from /tmp]	Load font file from `/tmp`-directory
[Load from ...]	Load font file from a selectable directory

► Use [SELECT] / [BACKSEL] to select the requested menu item and press [ENTER] to confirm.

> Menu page displays selected source.

3 Install font file

► Select the requested font file.

> Selected font file has focus.

► Press [LOAD] to save the selected font file on the device.

> After rebooting the device the installed font file can be used in CODESYS projects.

► Optional: Repeat steps 2 and 3 to install additional font file on the device.

Fonts: Remove the font

14372

To remove font file installed on the device:

1 Select menu page

► Navigation path: [SETUP] > [ACTIONS] > [FONTS] > [REMOVE FONT]

> Men page displays installed font files saved in the directory `/home/fonts`.

2 Remove font files

► Use [▲] / [▼] to select the requested font file (.ttf).

► Press [REMOVE] to remove the selected font file from the device.

> Font file is removed from the device.

► Optional: Repeat step 2 to remove additional font files from the device.

© ifm electronic gmbh www.ifm.com

Setup: Format the internal storage

9643

NOTICE

Risk of data loss!

> When this action is confirmed, all user data in the directory `/data` of the storage medium is irretrievably deleted!

► Save files that you will need to an external medium prior to formatting!

To format the user data of the device:

To format the device-internal storage:

1 Select menu page

► Navigation path: [SETUP] > [ACTIONS] > [FORMAT STORAGE]

> [Format internal Mass storage] menu page appears.

2 Speicher formatieren

► Press [ENTER] to start the formating process.

> The device-internal user data in directory `/data` is formated.

> Information bar displays a confirmation message.

5.4 PDF file viewer

Contents

PDF: Navigating in the PDF file....65
PDF-Viewer: Display PDF file in full-screen mode....66
PDF-Viewer: Display extended menu....67
PDF-Viewer: Display the tabel of content of the PDF file....68

11416

The setup menu uitlises a PDF file viewer. The operator can use it to display PDF files stored in the directories `/home/pdf` and `/media`.

To display a PDF file:

► Enter the setup mode (→ **Enter the setup mode** (→ p. 30))
► Select [PDF-Viewer] menu item.
► Use [ENTER] to change to the PDF file viewer.
► Choose one of the following options:

© ifm electronic gmbh www.

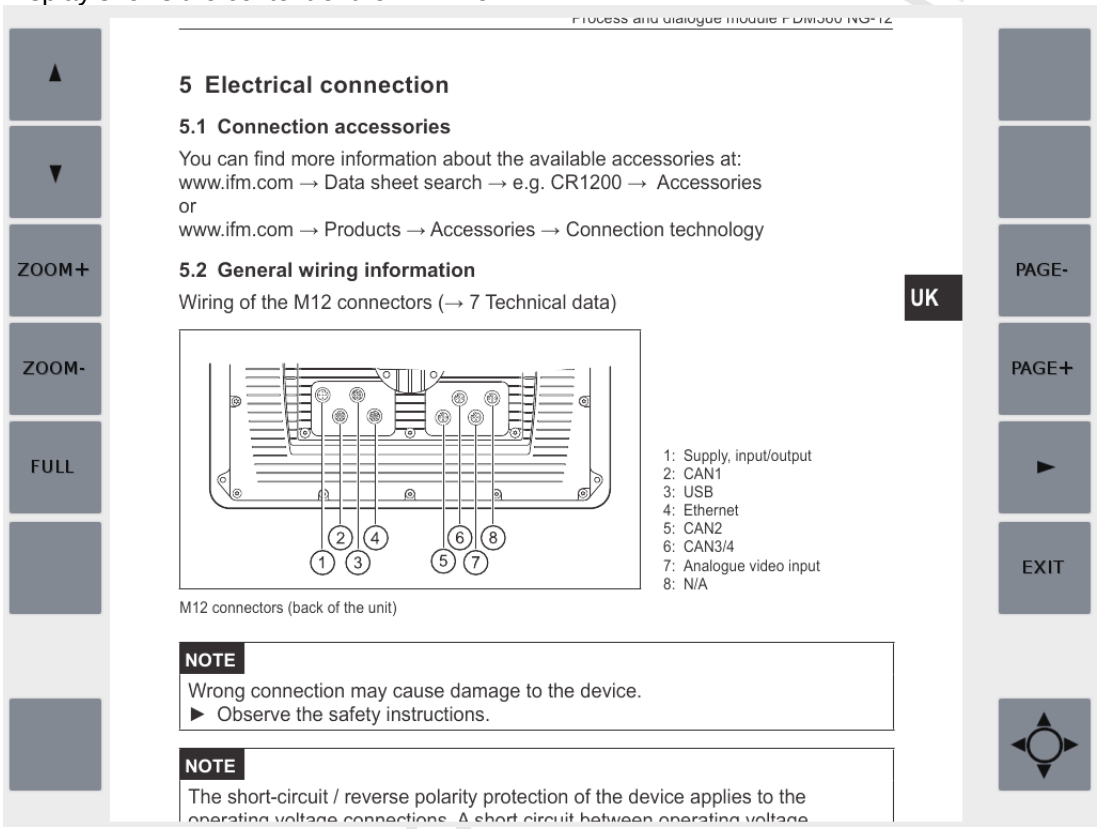

5.4.1 PDF: Navigating in the PDF file

11420

► Select requested PDF file and press [ENTER] to open the file (→ **Operation: Navigate in the file directory** (→ p. 35)).

> PDF file is loaded.

> Display shows the content of the PDF file:

► Use [▲] / [▼] to scroll up / down in the document.

► Use [ZOOM+] / [ZOOM-] to enlarge / reduce the document view.

► Use [PAGE+] / [PAGE-] to select the next / previous page of the PDF file.

► Use [▶] / [◀] to shift the document view to the right / left.

► Use [FULL] to change to the full-screen mode (→ **PDF-Viewer: Display PDF file in full-screen mode** (→ p. 66)).

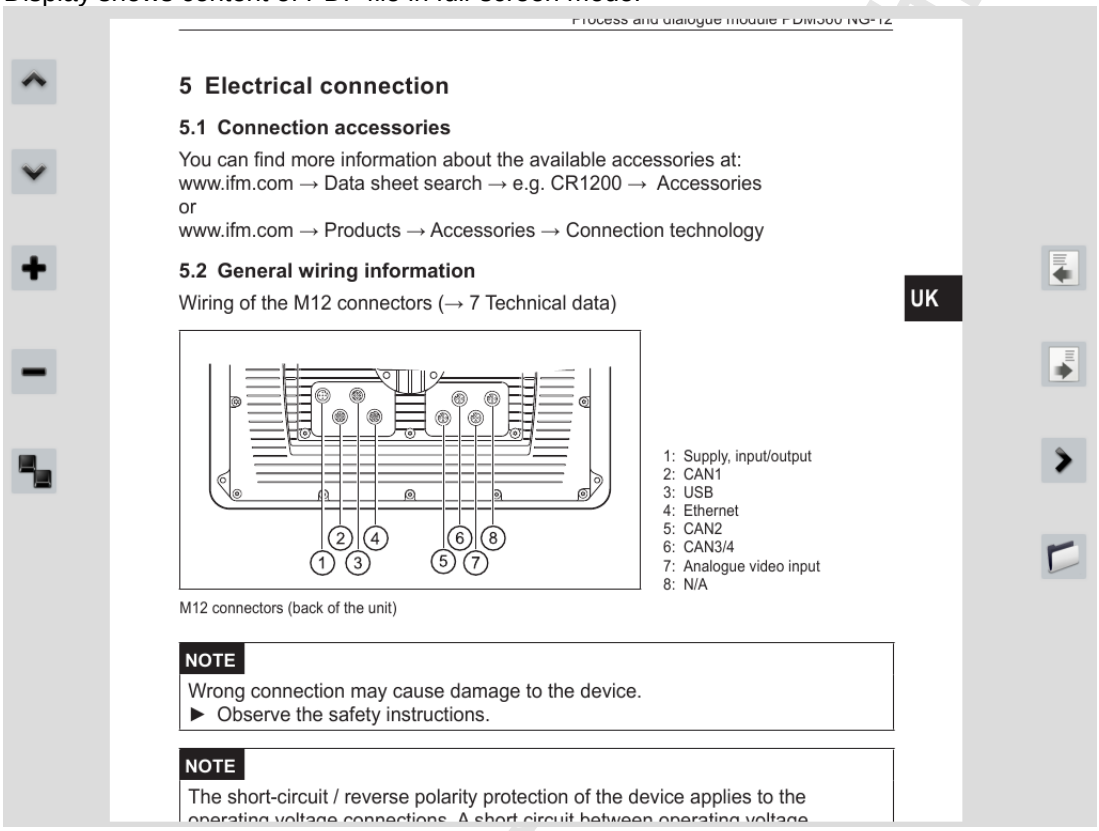

► Use [EXIT] to change to the extended menu (→ **PDF-Viewer: Display extended menu** (→ p. 67)).

© ifm electronic

5.4.2 PDF-Viewer: Display PDF file in full-screen mode

11422

► Load PDF file (→ **PDF file viewer** (→ p. 64)).
► Use [FULL] to change to the full-screen mode.
> Display shows content of PDF file in full-screen mode:

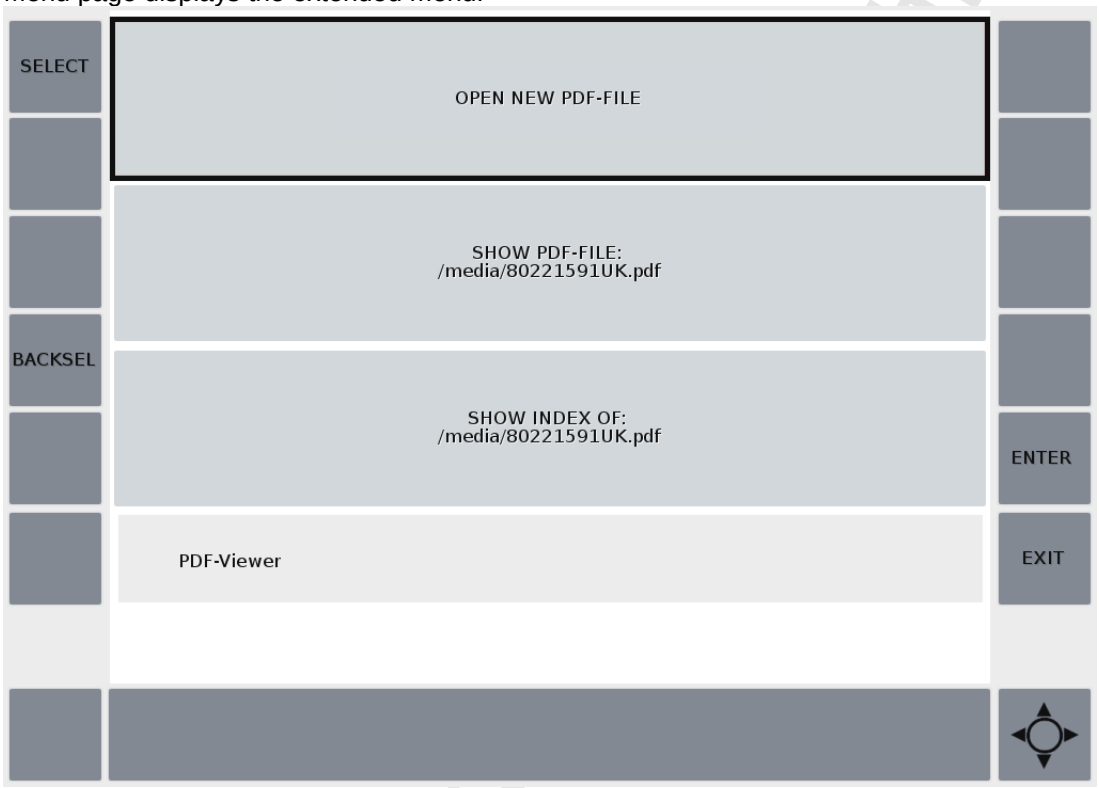

> Use [▲] / [▼] to scroll up / down in the document.
► Use [+] / [–] to enlarge / reduce the document view.
► Use / to select the next / previous page of the PDF file.
► Use [>] / [<] to shift the document view to the right / left.
► Use to return to the standard view (→ **PDF: Navigating in the PDF file** (→ p. 65)).
► Use [🗁] to change to the extended menu (→ **PDF-Viewer: Display extended menu** (→ p. 67)).

© ifm electronic

5.4.3 PDF-Viewer: Display extended menu

11424

► Start the PDF viewer (→ **PDF file viewer** (→ p. 64))
► Use [EXIT] to change to the extended menu.
> Menu page displays the extended menu:

► Use [SELECT] / [BACKSEL] to select one of the following menu items and press [ENTER]:

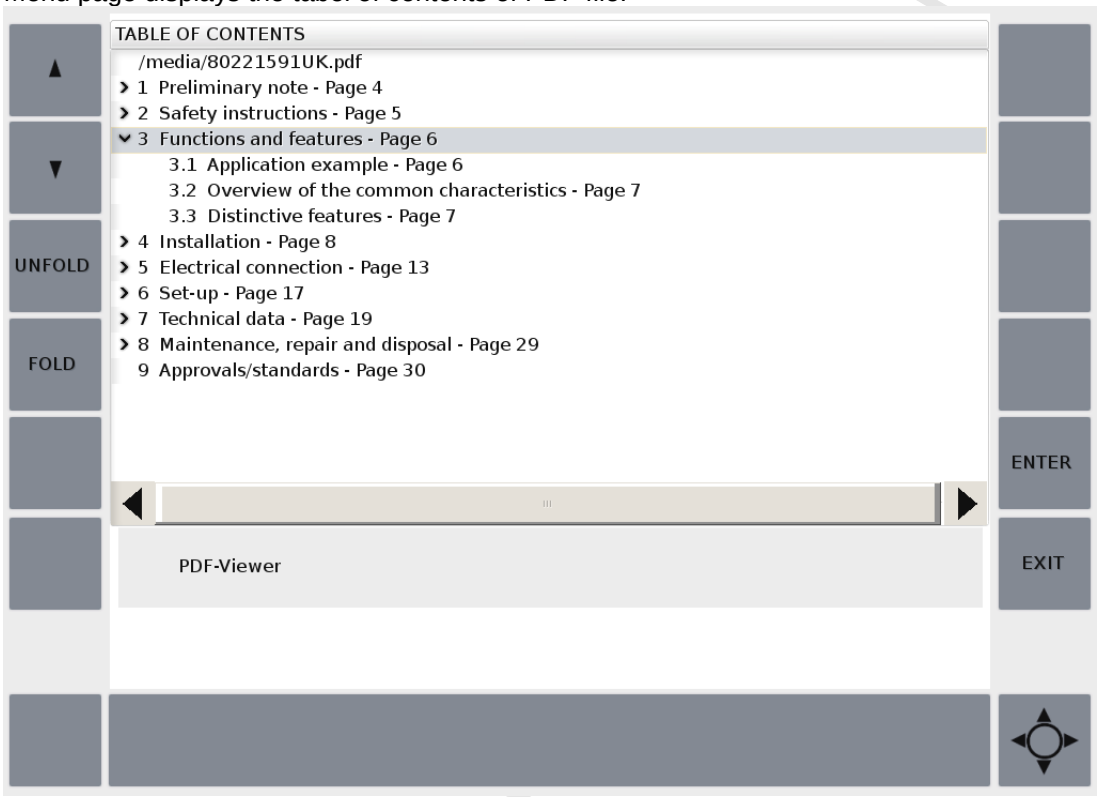

- [OPEN NEW PDF FILE] Open new PDF file
  → **PDF file viewer** (→ p. 64)
- [SHOW PDF FILE: /Verzeichnis/Dateiname] Open the selected PDF file
  → **PDF: Navigating in the PDF file** (→ p. 65)
- [SHOW INDEX OF: /Verzeichnis/Dateiname] Open index of the selected PDF file
  → **PDF-Viewer: Display the tabel of content of the PDF file** (→ p. 68)

© ifm electronic gmbh

5.4.4 PDF-Viewer: Display the tabel of content of the PDF file

11431

► Display PDF file in full-screen mode (→ **PDF-Viewer: Display PDF file in full-screen mode** (→ p. 66)).
► Change to extended menu (→ **PDF-Viewer: Display extended menu** (→ p. 67)).
► Select [SHOW INDEX OF: /Verzeichnis/Dateiname] menu item and press [ENTER].
> Menu page displays the tabel of contents of PDF file:

► Use [▲] / [▼] to select an item in the table of contents.
► Use [UNFOLD] to to expand the view of the item.
► Use [FOLD] to hide the view of the item.
► Use [ENTER] to display the content of the selected item.
► Use [EXIT] to return to the extended menu (→ **PDF-Viewer: Display extended menu** (→ p. 67)).

© ifm electronic

5.5 Setup: Start the application

11438

► Enter the setup mode (→ **Enter the setup mode** (→ p. 30))
► Select [LOAD APPLICATION] button.
► Use [ENTER] to start the application.

If a valid application program is saved:
> The application starts.
> The LED flashes green at 2 Hz (→ **Status LED**).

If **no** valid application program is saved:
> A white blank screen appears.
> The LED lights green.
► Transfer a valid application to the device via CODESYS
► Reboot the device (supply voltage OFF > ON)

© ifm electronic gmbh www.ifm.com

5.6 Automatically restore system files

14065

The function "Auto Restore" automatically identifies backup files saved in the root directory of a USB memory device (*.bup) and restores their contents. Several devices can be easily and time-savingly provided with the same software configuration (e.g. install a backup on controllers of the same type in several vehicles).

1 Create a backup file

► Enter the setup modus (→ **Enter the setup mode** (→ p. 30))

► Create backup of device configuration of the master device and store the backup file on an USB memory device (→ **Backup: Save the system files** (→ p. 58)).

The device only recognises backup files in the root directory of the USB memory device.

► Save the master backup file in the root directory of the USB memory device!

2 Automatically install the system files on the device

Only one backup file may be in the root directory of the USB memory device. If there are several backup files in the root directory, the automatic restore process will be stopped. An error message appears.

► Delete unneeded backup files in the root directory of the USB memory device!

► Connect the USB memory device with the master backup file with the target device

► Enter the setup mode (→ **Enter the setup mode** (→ p. 30))

► Select [SETUP] and press [ENTER] to change in the setup menu.

> The setup automatically recognises the structure and contents of the backup file.

> The menu screen shows the system components contained in the backup file.

► Press [START] to start the restore process.

> The selected system components are transferred to the device.

If successful:

> The menu screen shows the completion message.

3 Reboot the device

► Press [REBOOT] to reboot the device.

> Device reboots.

> If a valid project is loaded, this project is started after rebooting.
If no valid project is loaded, the device enters the setup mode after rebooting.

This chapter contains information about the first steps to program the CR1200 with CODESYS.

© ifm electronic gmbh

6.1 Start CODESYS

20930

Prerequisites

> Software components are correctly installed (→ **Installation** (→ p. 15)).

Start CODESYS

► Double-click on symbol [CODESYS V3.5 SP8]

> CODESYS starts.

> CODESYS user interface appears.

© ifm electronic gmbh www.ifm.com

6.2 Create CODESYS project

Contents

Create new project with CR1200 75
Add visualisation to the project 76
Overview: Project structure with CR1200 76

20938

► Familiarise yourself with the following CODESYS functions!
- Create a project
  → Online help > CODESYS Development System > Create and configure a project
- Manage a project
  → Online help > CODESYS Development System > Protect and save project

ifm electronic provides a special profile for each model of the device class "Dialogue module PDM360 NG". The user can choose the suitable profile during project creation.

© ifm electronic gmbh

6.2.1 Create new project with CR1200

17649

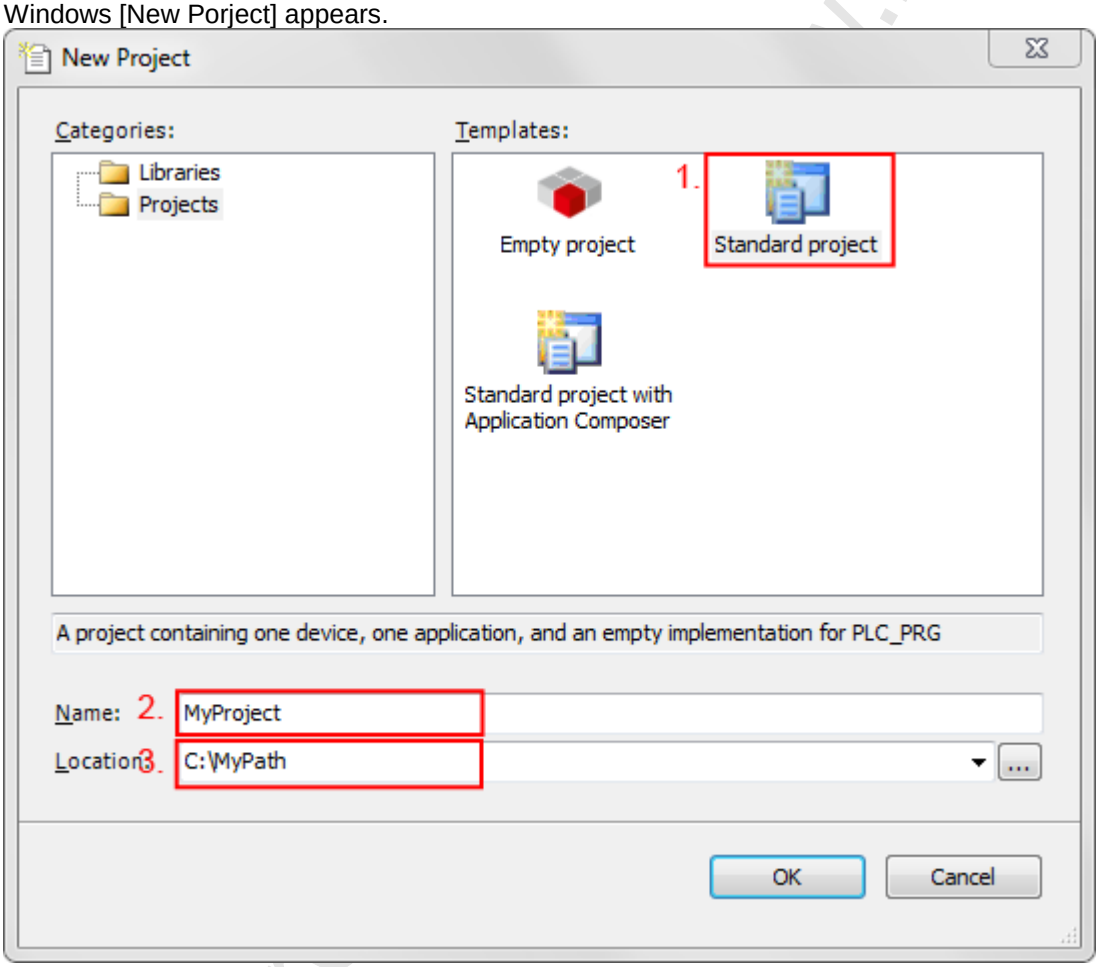

Requirements

► All required software components are correctly installed (→ **Installation** (→ p. 15)).

1 Create new CR1200 project

► Select [File] > [New Project...].

> Windows [New Porject] appears.

► Set the following values:
1. [Templates]: Select [Standard project]
2. [Name]: Enter project name
3. [Location]: Select storage location for the project file.

► Press [OK] to confirm the entered values.

> Window [Standard Project] appears.

► Set the following values:
1. [Device]: Select required device.
2. [PLC_PRG in]: Select required programming language.

► Press [OK] to confirm the entered values.

> CODESYS creates a new CR1200 project.

> Windows [Devices] shows a device tree of the project (→ **Overview: Project structure with CR1200** (→ p. 76)).

2 Save the project

► Select [File] > [Save Project].

> CODESYS saves the project.

6.2.2 Add visualisation to the project

2270

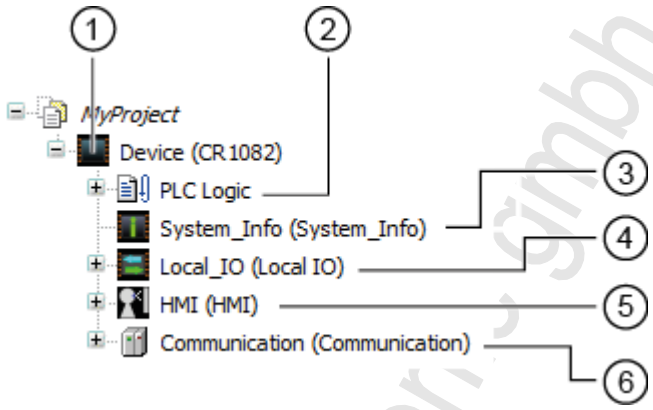

To add a visualisation for the representation of the user interface of the CR1200 to the project:

► In the device tree: Click on [Application].
► Select [Project] > [Add object] > [Visualization...].
> Window [Add Visualization] appears.
► Change the following settings:
1. [Name]: Enter designation for visualisation.
2. In the column [Active]: Activate checkbox for [VisuSymbols (System)].
► Click on [Add] to apply the changes.
> CODESYS adds visualisation elements to the device tree.
> Editor window shows the edit view of the visualisation.
► Save the project to apply changes.

6.2.3 Overview: Project structure with CR1200

8573

A CODESYS project contains all components for configuration, management and programming of the CR1200. All components of a project are shown in the window [Devices] in a hierarchic tree view. CODESYS projects with a CR1200 have the following structure:

(1) [Device (CR1200)] provides access to the settings of CR1200.
→ **Configure PLC** (→ p. 82)

(2) [PLC Logic] provides access to the objects in the PLC applications.
→ **Objects of a PLC application** (→ p. 93)

(3) [System_Info] provides access to the device information.
→ **Display system information** (→ p. 142)

(4) [Local_IO] provides access to configuration options of the inputs and outputs
→ **Configure inputs and outputs** (→ p. 83)

(5) [HMI] provides access to the configuration options of the operating and display elements.
→ **Configure device keys** (→ p. 85)

(6) [Communication] provides access to the configuration options of the communication interfaces.
→ **Configure CAN interfaces** (→ p. 87)

© ifm electronic gmbh www.ifm.com

6.3 Use CODESYS user manual

15221

This manual only describes the integration, configuration and the programming of the CR1200 using the CODESYS development system.

For the description of user actions and user interface elements the CODESYS terminology will be used.

Standard functions and methods of CODESYS will not be described. At the beginning of each section there will be a reference to the corresponding chapters of the CODESYS online help.

To access the online help of the CODESYS development system:

► Start CODESYS.

> The CODESYS user interface appears.

► Press [F1].

> Online help of the CODESYS development system appears.

► Familiarise yourself with the CODESYS development system! In particular with the following topics:
- Names and functions of the user interface elements
- Basic menu functions
- Programming techniques and methods for data retention

© ifm electronic gmbh www.ifm.com

6.4 Configure programming interface

21784

Programming of the device-internal PLC is made via the Ethernet interface of the device (position of the connections: → Installaton instructions).

Device and PC/laptop can be coupled directly or indirectly via an Ethernet network.

► Only use the recommended accessories for connection of the Ethernet interfaces! (→ Installation instructions).

► For the connection in the network an experienced user or system administrator should set up the network addresses and do the configuration.

6.4.1 Set communication path of PLC

13901

To configure the communication path between the programming system CODESYS and the device-internal PLC:

Preparations

> CODESYS PC/laptop and Ethernet interface of the device are connected.

> Optional: Adjust IP settings of the Ethernet interface.

1 Select communication settings

► In the device tree: Double-click on symbol [Device (CR1200)]

> In the editor window: Select tab [Communication].

> Editor window shows communication settings.

2 Select gateway

► Select the requested gateway in the list [Gateway].

> List shows selected gateway.

3 Set communication path

► Activate [Scan Network …].

> Window [Select Device] appears.

► Select gateway node and start scan process with [Scan network].

> CODESYS scans network for devices.

> Window shows network path and detected devices.

► Select node of the device and activate [OK] to set the communication path to the device-internal PLC.

> CODESYS can transfer data to the device-internal PLC.

© ifm electronic gmbh www.ifm.com

6.5 Add ifm function libraries to the application

21775

► Familiarise yourself with the following CODESYS functions!
- Library manager
  → Online help > CODESYS Development System > Use libraries > Adding a library to the application

The ifm package includes function libraries for the programming of the device under CODESYS. The libraries are installed in CODESYS together with the ifm package.

The user can add the libraries individually to an application he needs for the programming.

By means of the container library `ifmPDM360NG.library` the user can add all functions available for the device to the project.

To integrate a library into a project:

Prerequisites

> ifm package is correctly installed (→ **Install ifm package** (→ p. 18)).

Load container library

► In the device tree: Double-click on [PLC Logic] > [Application] > [Library Manager]
> Editor window shows table of added libraries.
► Click on [Add library].
> Dialogue window [Add library] appears.
► Select requested library and click on [OK] to add the selected library to the application.
> CODESYS adds the selected library to the project.
> Editor window shows the library.

6.6 Activate the access protection for a project

21783

► Familiarise yourself with the following CODESYS functions!
- Protect and save project
  → Online help > CODESYS Development System > Protect and save project

The user can use a password to protect the device from unauthorised access.

► Select [Project] > [Project Settings...].
> Window [Project Settings] appears.
► Select [Security].
► Activate checkbox [Enable project file encryption].
► Enter the requested password in the field [New password].
► Enter the entered password again in the field [Confirm new password].
► Select [OK] to activate the access protection for the project.
> Access protection is activated. Project is encrypted.

© ifm electronic gmbh www.ifm.com

6.7 Access the Linux system of the device

21785

The user can access the Linux system of the device directly via the Ethernet interface. The following options are supported:

Option	Description	Example application
Telnet	Unencrypted access to the Linux command line	Putty (→ www.putty.org)
SSH	Encrypted access to the Linux command line	Putty (→ www.putty.org)
FTP	Unencrypted access to the Linux file system (copy files)	WinSCP (→ www.winscp.net)
SCP	Encrypted access to the Linux file system (copy files)	WinSCP (→ www.winscp.net)

The following login data is factory-preset:
User name/login: root
Password: pdm360ng

© ifm electronic gmbh

7 System configuration

Contents

Configure PLC 82
Configure inputs and outputs 83
Configure device keys 85
Configure CAN interfaces 87

11505

The device tree of the CODESYS project provides different possibilities to configure the properties of the device.

For configuration options in the CODESYS application: → **Configure system** (→ p. 100)

© ifm electronic gmbh

7.1 Configure PLC

22073

The configuration of the PLC of the CR1200 is made via the "Generic device editor" of the CODESYS programming system.

► Familiarise yourself with the following CODESYS functions!

- Device editor
  → Online help > CODESYS Development System > Reference user interface > Objects > Object 'Device' and Generic device editor

The configuration of the PLC is made via the node [Device (CR1200)] of the device tree.

To configure the PLC of the CR1200:

► In the device tree: Double-click on [Device (CR1200)]

> Editor window shows device editor of the PLC of the CR1200.

© ifm electronic gmbh www.ifm.com

7.2 Configure inputs and outputs

Contents

Set operating mode of the inputs 84
Set operating mode of the outputs 84

10378

On delivery the following default settings are preset:

- Operating mode of the inputs and outputs: Binary (positive-switching)
- Diagnostic function: Active
- Overload protection: active

© ifm electronic gmbh www.ifm.com

7.2.1 Set operating mode of the inputs

10374

The input of the device can be operated in different operating modes. The user can set the operating mode of the input via the parameter [IN0000]. The device supports the following operating modes:

Parameter	Description	Possible values	
[IN0000]	Operating mode of the input IN0000	IN_DIGITAL_CSI	Digital input current sinking (positive-switching, low-side)
		IN_DIGITAL_CSO	Digital input current sourcing (negative-switching, highside)
		IN_VOLTAGE_10	Voltage input 0...10 V
		IN_VOLTAGE_32	Voltage input 0...32 V
		IN_VOLTAGE_RATIO	Voltage input ratiometric
		IN_CURRENT_CSI	Current input 0...20 mA

Technical details of the supported operating modes: →Installaton instructions.

To configure the operating mode of the input:

► In the device tree: Double-click on symbol [Local_IO] > [Inputs]
► In the editor window: Select tab [Parameter].
> Editor window shows table current operating mode.
► In line [Mode]: Select the requested operating mode from the list in the column [Wert].

7.2.2 Set operating mode of the outputs

10375

The operating mode of the output is fixed. The device supports the following operating modes:

Parameter	Description	Possible values	
[OUT0000]	Operating mode of the output OUT0000	OUT_DIGITAL_CSO	Digital output, current sinking (positive-switching, highside)

Technical details of the supported operating modes: →Installaton instructions.

© ifm electronic gmbh www.ifm.com

7.3 Configure device keys

Contents

Set the brightness of the key LEDs 86
Set key assignment (key mapping) 86

14626

© ifm electronic gmbh www.ifm.com

7.3.1 Set the brightness of the key LEDs

11502

The user can set the brightness of the key LEDs via the following parameters:

Parameter	Description	Possible values
[LED bright]	Brightness of the key LEDs in normal mode (values in %)	0...100*
[LED bright night]	Brightness of the key LEDs in night mode (values in %)	0...15*...100

* Default setting

To set the brightness of the key LEDs for normal mode and night mode:

► In the device tree: Double-click on [Device] > [HMI] > [Key_Backlight_settings]
► Select tab [Parameter]
> Table shows the current parameter settings.
► Enter the desired value for [LED bright] and [LED bright night] in the column [Wert].

7.3.2 Set key assignment (key mapping)

7422

By means of key mapping certain keyboard functions can be assigned to the operating elements. This enables the user to access the input elements of the visualisation (on-screen keyboard, numpad) directly via the pushbuttons.

To assign certain keyboard functions to the operating elements:

► In the device tree: Double-click on [HMI] > [Keyboards] > [Key_Mapping]
► Select tab [Parameter].
> Detail window shows table with current key mapping.
► Assign the requested keyboard function to each operating element in the column [Wert].
► Save the project to apply changes.

Key mapping can only be used if the parameter [Activate standard keyboard handling] is activated in the visualisation manager.

► Activate standard keyboard operation (→ **Use visualisation manager** (→ p. 111)).
► Note symbol names of the operating elements (→ **Symbol names of the operating elements** (→ p. 97)).

One keyboard function can be simultaneously assigned to several operating elements.

© ifm electronic gmbh www.ifm.com

7.4 Configure CAN interfaces

Contents

Add and configure CANbus 88
RawCAN: Configure CANLayer 2 89
CANopen: Configure CANopen Manager (master) 89
CANopen: Configure CANopen Device (slave) 90
J1939: Configure J1939 Manager 91

14645

► Familiarise yourself with the following CODESYS functions!
  - CAN-based fieldbuses
    → Online help > Fieldbus support > CAN-based fieldbuses

The device has 4 CAN interfaces. Each CAN interface supports the following protocols:

- RawCAN (CAN Layer 2)
- CANopen Manager
- CANopen Device
- J1939 Manager

► Observe the notes about task configuration! (→ **Configure task processing** (→ p. 131))
► Add an individual CANbus device to the device tree for each CAN interface used in the application!

© ifm electronic gmbh www.ifm.com

7.4.1 Add and configure CANbus

2271

► Familiarise yourself with the following CODESYS functions!
- CANbus settings
  → Online help > Fieldbus support > CAN-based fieldbuses > Tab "CANbus - General"
- CANbus-I/O representation
  → Online help > Fieldbus support > CAN-based fieldbuses > Tab " I/O representation"

► Add an individual CANbus device to the project tree for each CAN interface.

1 Add CAN interface

► In the device tree: Right-click on [CAN]
> Context menu appears.
► Select [Add Device…].
> Window [Add Device] appears.
► Set the following values:
1. [Vendor]: Select ifm electronic.
2. In the table: Select [ifmCANbus].
3. [Name]: Enter unambiguous name for the CAN interface.

► Select [Add Device] to add a CAN interface to the device tree.
> In the device tree: CAN interface appears as subelement of [CAN (CAN)].

2 Configure CAN interface

► In the device tree: Double-click on the added CAN node
> Editor window shows setting options of the CAN interface.
► Select the CAN ID of the CAN network in the field [Network].
► Select the transmission rate of the CAN network in the list [Baud rate (bit/s)].

Continue with:

- **RawCAN: Configure CANLayer 2** (→ p. 89)
- **CANopen: Configure CANopen Manager (master)** (→ p. 89)
- **CANopen: Configure CANopen Device (slave)** (→ p. 90)
- **J1939: Configure J1939 Manager** (→ p. 91)

© ifm electronic gmbh www.ifm.com

7.4.2 RawCAN: Configure CANLayer 2

14646

No further actions are required to use a CAN interface as CANLayer 2 (RawCAN). The user can access the CAN interface directly in the application.

More information about programming of the RawCAN interface: → **Use RawCAN (CAN Layer 2)** (→ p. 129)

7.4.3 CANopen: Configure CANopen Manager (master)

11744

► Familiarise yourself with the following CODESYS functions!
- CANopen Manager
  → Online help > Fieldbus support > CAN-based fieldbuses > CANopen > CANopen Manager

The configuration of the CANopen Manager is based on the CANopen Stack of the CODESYS 3.5 programming system.

Prerequisites

> Add and configure CAN interface (→ **Add and configure CANbus** (→ p. 88))

1 Add CANopen Manager

► In the device tree: Right-click on the added CAN node
> Context menu appears.
► Select [Add Device…] in the context menu.
> Dialogue window [Add Device] appears.
► Set the following values:
1. [Vendor]: [<All manufacturers>]
2. In table: Select [CiA CANopen] > [CiA CANopen Manager] > [CANopen Manager].
3. [Name]: Enter unambiguous name.

► Activate [Add Device].
> CODESYS adds CANopen Manager to the device tree.

2 Configure CANopen Manager

► In the device tree: Double-click on the added CANopen Manager
> Editor window shows configuration options.
► Configure CANopen Manager as requested.
► Save the project to apply changes.

More information about programming of the CANopen interface: → **Use CANopen** (→ p. 127)

© ifm electronic gmbh www.ifm.com

7.4.4 CANopen: Configure CANopen Device (slave)

14644

► Familiarise yourself with the following CODESYS functions!
- CANopen Local Device
  → Online help > Fieldbus support > CAN-based fieldbuses > CANopen > CANopen Device

The configuration of the CANopen Device is based on the CANopen Stack of the CODESYS 3.5 programming system.

Prerequisites

► Add and configure CAN interface (→ **Add and configure CANbus** (→ p. 88))

1 Add CANopen Device

► In the device tree: Right-click on the added CAN node
> Context menu appears.
► In the context menu: Select [Add Device…].
> Dialogue window [Add Device] appears.
► Set the following values:
1. [Vendor]: [<All manufacturers>]
2. In table: Select [CiA CANopen] > [CiA Locale Device] > [CANopen Device].
3. [Name]: Enter unambiguous name.
► Activate [Add Device] to add a CANopen Device to the project.
> CODESYS adds CANopen Device to the device tree.

2 Configure CANopen Device

► In the device tree: Double-click on the added CANopen Device
> Editor window shows configuration options.
► Configure CANopen Device as requested.
► Save the project to apply changes.

More information about programming of the CANopen interface: → **Use CANopen** (→ p. 127)

© ifm electronic gmbh www.ifm.com

7.4.5 J1939: Configure J1939 Manager

11743

The configuration of the J1939 Manager is based on the J1939 Stack of the CODESYS 3.5 programming system.

► Familiarise yourself with the following CODESYS functions:

- J1939 Manager
  → Online help > Fieldbus support > CAN-based fieldbuses > J1939 > J1939-Manager

To configure a CAN interface as J1939 Manager:

Prerequisites

> Add and configure CAN interface (→ **Add and configure CANbus** (→ p. 88))

1 Add J1939 Manager

► In the device tree: Right-click on the added CAN node.
> Context menu appears.
► Select [Add Device…] in the context menu.
> Dialogue window [Add Device] appears.
► Set the following values:
1. [Vendor]: <All manufacturers>
2. In table: Select [SAE J1939] > [SAE J1939 Manager].
3. [Name]: Enter unambiguous name.
► Activate [Add Device].
> CODESYS adds J1939 Manager to the device tree.

2 Configure J1939 Manager

► In the device tree: Double-click on the added J1939 Manager
> Editor window shows configuration options.
► Configure J1939 Manager as requested.
► Save the project to apply changes.

8.1 Objects of a PLC application

3084

All objects of a PLC application are listed as subelements of the node [Application] in the device tree.
In the basic configuration a PLC application contains the following objects:

(1) [Application] is a container for objects of a PLC application

(2) [Library Manager] provides access to the standard and device-specific function libraries:
→ **Use ifm function libraries** (→ p. 99)

(3) [PLC_PRG(PRG)] provides access to the editor of the PLC application
→ **Create PLC application** (→ p. 94)

(4) [Task Configuration] provides access to the settings of the task processing:
→ **Configure task processing** (→ p. 131)

(5) [Visualization Manager]: Set properties of the visualisation:
→ **Use visualisation manager** (→ p. 111)

(6) [MyVisu]: Visualisation page:
→ **Create visualisation** (→ p. 110)

If necessary, the user can add further objects to the PLC application.

© ifm electronic gmbh
www.ifm.com

8.2 Create PLC application

14625

► Familiarise yourself with the following CODESYS functions!
  ▪ → Online help > CODESYS Development System > Create application

CODESYS automatically generates the function block PLC_PRG (PRG) during project creation. The function block is processed cyclically. Other programs are called in this function block.

To create a PLC application:

► In the device tree: Double-click on [Application] > [PLC_PRG (PRG)]

> Editor window shows input mask of the selected programming language.

► Enter program code.

8.2.1 Notes

10376

Supported programming languages

21752

The following table shows which programming languages according to IEC 61131 are supported by the ifm function libraries:

Library	Function block language (FUP)	Sequential function chart (SFC)	Instruction list (IL)	Continuous function chart (CFC)	Ladder diagram (LD)	Structured text (ST)
ifmPDM360NGutil.library	X	X	X	X	X	X
ifmCANopenManager.library	X	X	X	X	X	X
ifmRawCAN.library	X	X	X	X	X	X
ifmEthernet.library	X	X	X	X	X	X
ifmFileUtil.library	X	X	X	X	X	X
ifmIOcommon.library	X	X	X	X	X	X
ifmSysInfo.library	X	X	X	X	X	X
ifmUSBstorageUtil.library	X	X	X	X	X	X

Legend:
X ... is supported
– ... is not supported

© ifm electronic gmbh www.ifm.com

Available memory

21780

Memory area	Size
Total memory space*	RAM: 128 Mbytes Flash: 128 Mbytes
▪ Reserved for program code	8 Mbytes
Memory for retain data **	32 Kbytes
Memory for bitmap files (80 x 100pixels each, 24-bit colour depth)	45 Mbytes
Memory for fonts (font files)	
Memory space required by the system itself	75 Mbytes
Memory in the directory `/tmp`	Cannot be ensured
Data memory `/data`	1024 Mbytes

Legend:
* ... Size of the memory: Data sheet
** ... Retain data: Retain variables (→ **Supported variable types** (→ p. 96))

The device does not support an online change (= possibility to change the application code online without previously deleting the original application)

The data memory /data is NOT automatically initialised during the start process. To use the data memory:

► Integrate the data memory in the application into the file system of the device by means of the FB **InitNANDflashAsync** (→ p. 213).

The storage capacity of the device can be extended by an external USB memory device. The USB connectors of the device are not suitable for permanent operation in mobile applications.

► External USB memory device is only for momentary use (e.g. to back up files)!

© ifm electronic gmbh www.ifm.com

Supported variable types

21762

► Familiarise yourself with the following CODESYS functions!
- Local variables
  → Online help > CODESYS Development System > Reference programming > Variable types and special variables > Local variables - VAR
- Global variable list
  → Online help > CODESYS Development System > Reference programming > Variable types and special variables > Global variables - VAR_GLOBAL
- Network variables
  → Online help > CODESYS Development System > Exchange data in the network > Network variables

The device supports the following variable types:

Variable type	Declaration	Scope of validity	Memory behaviour
Local	In the declaration part of the POU	Applies only to the POU in which it has been declared	Volatile
Local retain			Non volatile
Global	In the global variable list (GVL)	Applies to all POUs of the project	Volatile
Global Retain			Non volatile
Network	In network variable lists	Values are available to all projects in the whole network if the variable is contained in their network variables lists.	Volatile
Network retain			Non volatile

CAN network variables are not supported!

Restrictions

21756

The device is designed as a display for representing process data. It is thus conditionally real-time capable. Computationally intensive processes can cause long cycle times.

► Avoid computationally intensive functions!
This includes the following functions:
- Controller
- Encoder
- Control of diesel engines
- Operation as CANopen master

► Monitor the cycle time during the runtime of the PLC program!
Cycle times in the range from 5 ... 10 ms are no problem.

© ifm electronic gmbh www.ifm.com

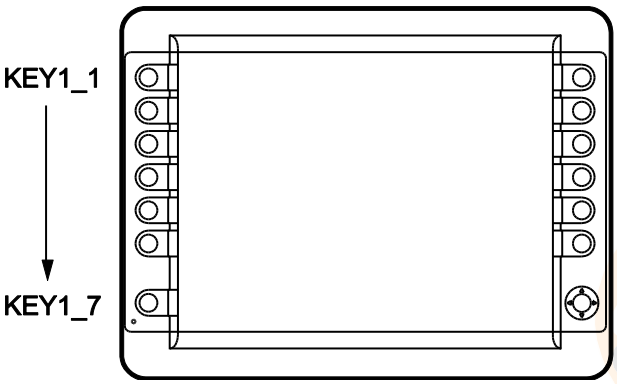

Symbol names of the operating elements

12652

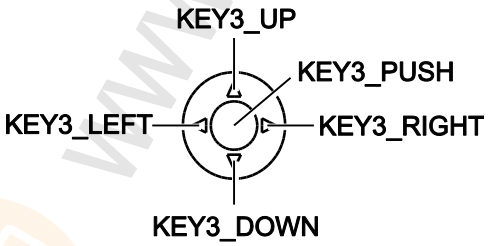

Certain symbol names are assigned to the operating elements of the device. By means of these symbol names the programmer can define certain actions and functions to be triggered upon actuation of the correspondent operating element (→ **Map functions to operating elements** (→ p. 112)).

The following figure shows the symbol names of the individual operating elements:

Function keys:

Navigation key:

Watchdog behaviour

11789

In this device a watchdog monitors the runtime of system processes, including the process of the CODESYS application. Each process has to call the watchdog monitor within a defined time intervall (watchdog timeout). If the maximum watchdog time is exceeded:

> all processes are stopped (reset)
> all outputs are switched off
> the screen goes black
> the status LED flashes red at 5 Hz

A process needs a certain time to proceed reset and initialisation routines (watchdog reset).

The following tabel shows the watchdog times for each process:

Prozess	Chain-ID	Watchdog-Timeout [ms]	Watchdog-Reset [ms]
ppc-plclinux	10	1 000	500
eplc main	20	10 000	500
eplc overlay	21	10 000	500
keyboard-service	40	2 000	500
io-coproc-service	50	2 000	500
wd-coproc-service	60	2 000	500

Eliminate the fault:

► Reboot the device via voltage on/off plus.

© ifm electronic gmbh www.ifm.com

Operating sequence

7427

In principle, there are two options to create a project for display devices:

Sequence	Advantages	Disadvantages
Visualisation first, then the PLC program.	▪ In the program it is possible to cross-reference to the finished images. ▪ When the PLC program is tested the images already exist.	The PLC parameters and variables required in the images have not yet been defined.
PLC program first, then the visualisation	All parameters and variables are defined in the PLC program before they are referred to in the visualisations.	▪ The parameters from the images (image number, key, LED, etc.) must be found elsewhere. ▪ The PLC program can only be tested after creation of the visualisation.

In both cases we urgently recommend to design a precise structure of the visualisation and its contents **before** starting.

14624

ifm provides the following function libraries for the programming of the device under CODESYS 3.5:

Name	Description
ifmDevicePDM360NG.library	Data structures, enumeration types and global variables
ifmPDM360NGutil.library	Device-specific functions
ifmIOcommon.library	Functions for access to the inputs and outputs of the device
ifmCANopenManager.library	Functions for use of the CAN interfaces as CANopen Manager
ifmRawCAN.library	Functions for use of the CAN interfaces as CAN Layer 2
ifmFileUtil.library	File and help functions
ifmEthernet.library	Functions for the management of the IP settings of the Ethernet interface
ifmUSBstorageUtil.library	Functions for the management of USB memory devices

Detailed information about the ifm function libraries: → **ifm function libraries** (→ p. 145)

© ifm electronic gmbh

8.3.1 Configure system

14370

The following function elements are available to configure the device:

Name	Description	Reference
DisableTouchScreen*	Activate /deactivate touch functionality of the display	→ DisableTouchScreen (→ p. 211)
InitNANDflash	Initialise flash memory of the device	→ InitNANDflashAsync (→ p. 213)
LoadSplashScreen	Load individual start screen	→ LoadSplashScreen (→ p. 217)
SetBootupBacklight	Set the brightness of the display during start-up	→ SetBootupBacklight (→ p. 219)
SetKeyClick	Configure the sound generated upon actuation of a function key	→ SetKeyClick (→ p. 221)
BuzzerClick	Configure the sound generated by the device-internal buzzer	→ BuzzerClick (→ p. 223)

* ... only available for devices with touch screen

8.3.2 Configure Ethernet interface

11515

The following function elements are available to manage the settings of the Ethernet interface of the device:

Name	Description	Reference
GetIPsettings	Read IP settings of the Ethernet interface	→ GetIPsettings (→ p. 160)
SetIPsettings	Change IP settings of the Ethernet interface	→ SetIPsettings (→ p. 162)

The current IP settings of the Ethernet interface can be read in the online mode via the device tree (→ Display system information (→ p. 142)).

8.3.3 Control device

12322

The following function elements are available to manage the device:

Name	Description	Reference
BuzzerOn	Activate/deactivate device-internal buzzer with a specific frequency	→ BuzzerOn (→ p. 209)
LinuxSysCallAsync	Command transmitted to the Linux operating system of the device	→ LinuxSysCallAsync (→ p. 215)
SupplySwitch	Switch off the unit	→ SupplySwitch (→ p. 203)

© ifm electronic gmbh

8.3.4 Manage files

11507

The following function elements are available to manage (copy, delete) the files and directories:

Name	Description	Reference
Copy_PDM_To_USB	Copy files from the device to a USB memory device	→ Copy_PDM_To_USB (→ p. 166)
Copy_USB_To_PDM	Copy files from a USB memory device to the device	→ Copy_USB_To_PDM (→ p. 168)
DeleteFile	Delete the file from the device	→ DeleteFile (→ p. 170)
FileCopy	Copy files on the device	→ FileCopy (→ p. 172)
SyncFileMemory	Synchronise the contents of the FLASH memory and the RAM	→ SyncFileMemory (→ p. 174)

8.3.5 Manage CSV files

10377

The following function elements are available to manage (create, change, read) CSV files:

Name	Description	Reference
ReadCSV8Byte	Read the contents of a CSV file	→ ReadCSV8Byte (→ p. 176)
WriteCSV8Byte	Write the contents of a CSV file	→ WriteCSV8Byte (→ p. 178)
WriteCSV8ByteHeader	Write header section of a CSV file	→ WriteCSV8ByteHeader (→ p. 181)

8.3.6 Use help functions

11612

The user can use the following help functions:

Name	Description	Reference
GetMemoryInfoAsync	Display memory used of the device	→ GetMemoryInfoAsync (→ p. 191)
ByteArray_To_String	Convert array from bytes into a character string	→ ByteArray_To_String (→ p. 193)
Buffer_To_String	Convert array from bytes into an array of character strings	→ Buffer_To_String (→ p. 187)
Pack2Byte_To_Word	Convert 2 bytes into a word	→ Pack2Byte_To_Word (→ p. 195)
Pack4Byte_To_DW	Convert 4 bytes into a double word	→ Pack4Byte_To_DW (→ p. 196)
Word_To_2Byte	Convert word into 2 bytes	→ Word_To_2Byte (→ p. 198)
_8Byte_To_CSV	Convert array from 8 bytes into CSV format.	→ _8Byte_To_CSV (→ p. 199)
DW_To_4Byte	Convert DWORD into 4 bytes	→ DW_To_4Byte (→ p. 194)
RTC_To_String	Provide operating time of the device as STRING	→ RTC_To_String (→ p. 197)
GetFileSizeAsync	Display size of a file	→ GetFileSizeAsync (→ p. 189)
ReadParmSingleAsync	Read individual parameter set from a text file	→ ReadParmSingleAsync (→ p. 183)
WriteParmSingleAsync	Write individual parameter set into a text file	→ WriteParmSingleAsync (→ p. 185)

© ifm electronic gmbh www.ifm.com

8.4 Use system flags

10373

System flags are factory-set global variables. They are coupled to the IEC addresses (%Ixx, %Qxx). Via symbol names, the user has access to the following elements from the application:

- Inputs and outputs
- Functions of the operating elements
- Functions of the display elements
- States of system components and characteristic values

The addresses of the system flags can change if the PLC configuration is extended.
► While programming only use the symbol names of the system flags!

8.4.1 Access inputs and outputs

14623

The user can use the following global variables to access the operating modes and the values of the inputs and outputs of the device.

Variable	Data type	Access	Description	Possible values	
IN0000.ValueAnalogue	UINT	r	Value of the analogue input IN0000	0 ... 65535	0 ... 65535
IN0000.ValueDigital	BOOL	r	Value of the digital input IN0000	FALSE	Input deactivated
				TRUE	Input activated
OUT0000.ValueDigital	BOOL	r/w	Value of the output OUT0000	FALSE	Output deactivated
				TRUE	Output activated

Legend:
r ... read only
r/w ... read and write

The valid value range of the input depends on the active operating mode of the input.
► Observe configuration of the inputs! → **Set operating mode of the inputs** (→ p. 84)

© ifm electronic gmbh www.ifm.com

8.4.2 Read diagnostic data of the device

10372

The user can use the following global variables to access the current diagnostic data of the device:

Name	Data type	Access	Description	Possible values	
iTemperature0	INT	r	Temperature on the system board (value in °C)	-32768 ... 32767	
iTemperature1	INT	r	Temperature on the system board (value in °C)	-32768 ... 32767	
uiVoltageVBB15	UINT	r	Voltage at power input VBB15 (value in mV)	0 ... 65535	0 mV ... 65535 mV
uiVoltageVBB30	UINT	r	Voltage at power input VBB30 (value in mV)	0 ... 65535	0 mV ... 65535 mV
uiLightSensor	UINT	r	Brightness detected by the photoelectric sensor (in %)	0 ... 100	Minimum brightness ... Maximum brightness

Legend:
r ... read only

8.4.3 Set the brightness of the display

20925

The user can use the following global variables to change the brightness of the display:

Name	Data type	Access	Description	Possible values	
uiBacklightBrightness	UINT	r/w	Set the brightness of the display (in %)	0 ... 65535	0 % ... 100 %

Legend:
r/w ... read and write

Simultaneous access to the brightness of the display via the global variable and the FB**SetBootupBacklight** (→ p. 219)is not permitted!

© ifm electronic gmbh www.ifm.com

8.4.4 Control status LED

20939

The user can use the following global variable to control the status LED of the device:

Name	Data type	Access	Description	Possible values	
LED0.Value	BOOL	r/w	Activate/deactivate status LED of the device	FALSE	Status LED off
				TRUE	Status LED on
LED0.Colour_1	ENUM	r/w	LED colour for status ON	→ **LED_COLOUR (ENUM)** (→ p. 157)	
LED0.Colour_2	ENUM	r/w	LED colour for status OFF	→ **LED_COLOUR (ENUM)** (→ p. 157)	
LED0.Frequency	ENUM	r/w	Flashing frequency of the status LED	→ **LED_FLASH_FREQ (ENUM)** (→ p. 158)	

Legend:
r/w ... read and write

In case of an error the LED colour RED is set by the runtime system.
► Do not use the LED colour RED in the application!

8.4.5 Control buzzer (audio signalling device)

20940

The user can use the following global variables to change the properties of the device-internal buzzer (audio signalling device) and to control the buzzer:

Name	Data type	Access	Description	Possible values	
uiBuzzerFreq	UINT	r/w	Frequency of the buzzer sound (in Hz)	500 ... 5000	500 Hz ... 5000 Hz
xBuzzerON	BOOL	r/w	Activate or deactivate audio signalling device (buzzer)	FALSE	Buzzer off
				TRUE	Buzzer on

Legend:
r/w ... read and write

© ifm electronic gmbh

8.4.6 Control key LEDs

14482

The user can use the following global variables to control the LEDs of the operating elements of the device:

Name	Data type	Access	Description	Possible values	
xNightModeON	BOOL	r/w	Activate/deactivate night mode for lighting of the key LEDs	FALSE	Deactivate night mode
				TRUE	Activate night mode
LEDsKeyboard1.0	BOOL	r/w	Activate/deactivate LED of button KEY1_1 of the left key row	FALSE	LED off
				TRUE	LED on
LEDsKeyboard1.1	BOOL	r/w	Activate/deactivate LED of button KEY1_2 of the left key row	FALSE	LED off
				TRUE	LED on
LEDsKeyboard1.2	BOOL	r/w	Activate/deactivate LED of button KEY1_3 of the left key row	FALSE	LED off
				TRUE	LED on
LEDsKeyboard1.3	BOOL	r/w	Activate/deactivate LED of button KEY1_4 of the left key row	FALSE	LED off
				TRUE	LED on
LEDsKeyboard1.4	BOOL	r/w	Activate/deactivate LED of button KEY1_5 of the left key row	FALSE	LED off
				TRUE	LED on
LEDsKeyboard1.5	BOOL	r/w	Activate/deactivate LED of button KEY1_6 of the left key row	FALSE	LED off
				TRUE	LED on
LEDsKeyboard1.6	BOOL	r/w	Activate/deactivate LED of button KEY1_7 of the left key row	FALSE	LED off
				TRUE	LED on
LEDsKeyboard3.0	BOOL	r/w	Activate/deactivate LED of button KEY3_1 of the right key row	FALSE	LED off
				TRUE	LED on
LEDsKeyboard3.1	BOOL	r/w	Activate/deactivate LED of button KEY3_2 of the right key row	FALSE	LED off
				TRUE	LED on
LEDsKeyboard3.2	BOOL	r/w	Activate/deactivate LED of button KEY3_3 of the right key row	FALSE	LED off
				TRUE	LED on
LEDsKeyboard3.3	BOOL	r/w	Activate/deactivate LED of button KEY3_4 of the right key row	FALSE	LED off
				TRUE	LED on
LEDsKeyboard3.4	BOOL	r/w	Activate/deactivate LED of button KEY3_5 of the right key row	FALSE	LED off
				TRUE	LED on
LEDsKeyboard3.5	BOOL	r/w	Activate/deactivate LED of button KEY3_6 of the right key row	FALSE	LED off
				TRUE	LED on
LEDsKeyboard3.11	BOOL	r/w	Activate/deactivate LED of the Navigation key	FALSE	LED off
				TRUE	LED on

Legend:
r/w ... read and write

8.5 Use visualisations

Contents

Notes about visualisations 107
Create visualisation 110
Use visualisation manager 111
Configure visualisation 113

14604

► Familiarise yourself with the following CODESYS functions!

- Visualisations
  → Online help > CODESYS Visualization

The device supports the following visualisation types:

- Target visualisation

© ifm electronic gmbh www.ifm.com

8.5.1 Notes about visualisations

21786

Observe the following notes when creating visualisations.

Drawing area

8392

- The actual drawing area is equal to the resolution of the display.
- Virtual drawing area = 2560 x 1536 pixels
  (enlarges the actual drawing area)
- The left upper corner marks the home position (0,0) of the virtual and actual drawing area.
- All elements in and outside the virtual drawing area are calculated.

The images used in the project can be larger than the given drawing area. In this case only a selectable part of the image will be displayed.

image properties

21787

The images used in visualisations must have the following properties:

- **Colour depth:** 18 bits (recommended), 24 bits (maximum)
- **Formats**: BMP, BMP RLE compressed, JPG
- **Size:** Max. resolution of the display (→ installation instructions)

Images not corresponding to the size and colour requirements will be adapted accordingly during the processing of the application. Each time the image is opened, it must be resampled. This often leads to much longer times to change from one image to the other.

► Only use images in visualisations that meet the requirements on image and colour depth!

► Edit image files accordingly by means of an image processing software.

Use image collection

21788

► Familiarise yourself with the following CODESYS functions!

- Image collection
  → Online help > CODESYS Development System > Program application > Use image collection

To use own images in visualisations the user must first add the corresponding image files to an image collection in the application.

To add an image collection to a project:

► In the device tree: Mark node [Application].

► Select [Project] > [Add object] > [Image Pool...].

> Window [Add Image Pool] appears.

► Enter the name of the image collection and confirm with [Add].

> Image collection appears in the project tree as a subelement of the application.

© ifm electronic gmbh www.ifm.com

Use optical and acoustic feedback

14300

All operating elements are backlit withLEDs. The LEDs can be controlledin the application program.

► Only switch those key LEDs in the application which can be sensibly actuated in the current screen.

For all keys currently without function:

► Switch off keys LEDs in the application.

Request to press a certain key:

► Programm the key LED so that it flashes.

Night design of the operating elements:

- The LEDs for alle operating elements are dimmable.
- For operating at night the LEDs have ONE adjustable basic brightness for all operating elements. So the operating elements are also backlit if the key LEDs were not switched on.

To set the brightness of the key LEDs: → **Set the brightness of the display** (→ p. 103)
To control the night mode of the key LEDs: → **Control key LEDs** (→ p. 105)
To control the device-internal audio signalling device: → **Control buzzer (audio signalling device)** (→ p. 104)

Texts

7428

- The smallest font size which is clearly visible on the device is 8 points.
- Permissible fonts (true type fonts):
  - Arial (standard)
  - Courier New
  - Times New Roman
  - ifm ISO symbols
  - Loadable fonts

Install all fonts required for use in the application on the PC as well as on the device! (→ **Fonts: Load the font** (→ p. 62))

- Permissible font size:
  - Standard = 10 pixels
  - Max. = 72 pixels
  - Permissible nuances = 1 pixel
- Permissible font weights:
  - Normal (standard)
  - Italic
  - Bold
  - Bold cursive
- Permissible effects:
  - None (standard)
  - Underlined
  - Crossed out

- The following text scripts are accepted:
  - Western (standard)
  - Other scripts on request

© ifm electronic gmbh www.ifm.com

8.5.2 Create visualisation

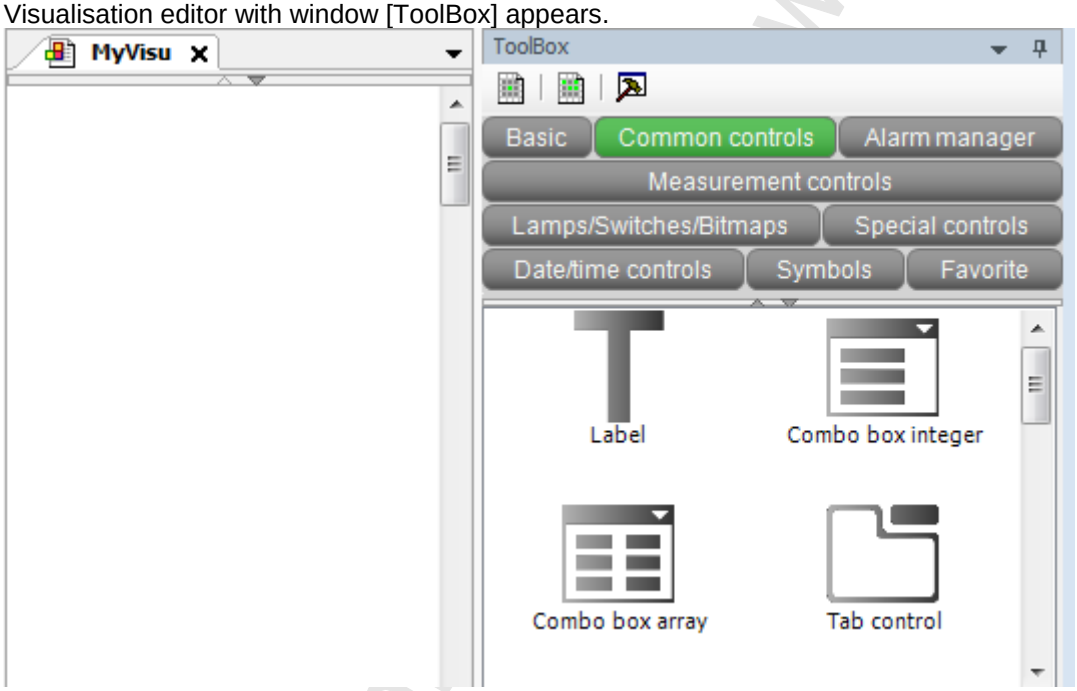

14940

► Familiarise yourself with the following CODESYS functions!
- Visualisation editor:
  → Online help > CODESYS Visualization > Visualisation editor
- Visualisation elements:
  → Online help > CODESYS Visualization > Visualisation elements

To create a visualisation for a PLC application:

► In the device tree: Double-click on [Visualization]

> Visualisation editor with window [ToolBox] appears.

► Create requested visualisation.

Observe the notes when creating the visualisation (→ **Notes about visualisations** (→ p. 107))!

► Save the project to apply changes.

© ifm electronic www.ifm.com

8.5.3 Use visualisation manager

15818

► Familiarise yourself with the following CODESYS functions!
- Visualisation manager
  → Online help > CODESYS Visualization > Visualisation manager with clients > Visualisation manager

The visualisation manager contains the general settings of the visualisations:

1 Start visualisation manager

► In the device tree: Double-click on [Application] > [Visualization Manager]

> Editor window shows visualisation manager.

2 Change general settings

► Select tab [Settings].

> Editor window shows general settings of the visualisations.

► Set the parameters as requested.

If the key mapping function (→ **Set key assignment (key mapping)** (→ p. 86)) is to be used, the standard keyboard operation must be activated.

► Activate the checkbox [Activate standard keyboard handling] in the area [Additional settings].

► Save the project to apply changes.

© ifm electronic gmbh www.ifm.com

Map functions to operating elements

20922

► Familiarise yourself with the following CODESYS functions!
- Keyboard configuration
  → Online help > CODESYS Visualization > Reference, User interface > Objects > Tab 'Visualization manager' - 'Default Hotkeys'

By using the CODESYS function [Default Hotkeys] the user can map certain function to the operating elements of the device (e.g. page switch, value switch). The defined keyboard functions are valid for all visualisations within the project.

To map a function to an operating element of the device:

1 Start visualization manager

► Start visualization manager.

> Editor window shows visualization manager.

2 Define keyboard functions

► In the editor windows: Select [Default Hotkeys] tab.

> Editor window shows the current configuration of the keyboard functions.

► Set the following values:
1. Column [Key]: Select required symbol name (→ **Symbol names of the operating elements** (→ p. 97)).
2. Column [Key down]: Define ON level
3. Column [Action type]: Select action type
4. Column [Action]: Select action.

3 Define additional keyboard functions

> Repeat step 2 to define additional keyboard functions.

Example: Signal actuation of the function key

20924

Goal: If the function key [KEY1_4] is pressed, the page "MyVisu" should be called.

1 Start visualisation manager

► Start visualisation manager.

> Editor window shows visualisation manager.

2 Define keyboard function

► In the editor window: Select tab [Default Hotkeys].

> Editor window shows current configuration of the keyboard functions.

► Set the following values:
1. Column [Key]: Select [KEY1_4]
2. Column [Key down]: Active checkbox
3. Column [Action type]: Select [Change shown Visualization]
4. Column [Action]: Activate checkbox [Assign] and select page "MyVisu"

© ifm electronic gmbh www.ifm.com

8.5.4 Configure visualisation

21576

To change the properties of the created visualisation:

► In the device tree: Double-click on [Visualization Manager] > [TargetVisu]

> Editor window shows properties of the target visualisation

► Set the following values:
1. [Start Visualization]: Select requested visualisation.
2. [Update rate (ms)]: 150
3. [Scaling options]: Fixed
4. [Antialiased drawing]: active
5. [Default text input]: Select requested input device.

► Save the project to apply changes.

Observe the notes about the configuration of the visualisation task!
→ **Configure visualisation task** (→ p. 132)

© ifm electronic gmbh www.ifm.com

8.6 Use mobile cameras

Contents

Supported cameras 115
Activate extensions for mobile cameras 115
Use Ethernet camera in the project 116
Using analogue cameras in the project 120

20928

The device supports the operation of mobile cameras.

Interface	Type of signal	Properties
Ethernet	Digital	▪ Up to 4 camera images representable at the same time ▪ Colour: 24 bits / greyscale: 8 bits ▪ Brightness of the camera image adjustable step by step (0...100: 0...100% ▪ Camera image and visualisation representable at the same time (overlaid) ▪ Failure of a camera is signalled ▪ Cameras can be activated / deactivated separately ▪ Rotation of the camera image possible by 90° / 180° / 270° ▪ Scaling of the camera image 0...400 % with unchanged proportion
Analogue video input (FBAS)	Analogue	▪ 2 analogue connections ▪ Automatic NTSC / PAL recognition ▪ 1 camera image representable at the same time ▪ Changing between 2 cameras possible ▪ Brightness of the camera image adjustable step by step (0...100%) ▪ Camera image and visualisation representable at the same time (overlaid) ▪ Failure of a camera is signalled ▪ Cameras can be activated / deactivated separately ▪ Rotation of the camera image possible by 90° / 180° / 270° ▪ Scaling of the camera image with unchanged proportion: 0...400 %

© ifm electronic gmbh www.

8.6.1 Supported cameras

SYS_OBJECTID>

	Analogue cameras	Ethernet cameras
Reference cameras (recommended)	ifm electronic: O2M200, O2M201, O2M202, O2M203	ifm electronic: O2M110, O2M113 (from firmware 5.1001)
Cameras from other manufacturers (tested)	▪ Motec: MC3100-3R ▪ Vision Techniques: VT70	--

► Only use recommended or tested cameras! The use of other cameras on the device is without warranty!

8.6.2 Activate extensions for mobile cameras

20923

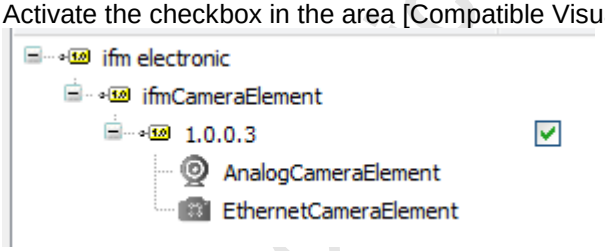

ifm electronic provides special visualisation extensions to add mobile cameras into a CODESYS project.

The library `ifmCameraElement.library` is part of the "CODESYS for ifm PDM360NG Products".

► Install CODESYS for ifm PDM360NG Products (→ **Install ifm package** (→ p. 18))

To activate the visualisation extensions:

► Open a project or create a new one.
► Select [Project] > [Project Settings...].
> Window [Project Settings] appears.
► Select [Visualization Profile].
► Activate the checkbox in the area [Compatible Visualization Extensions].

► Click [OK] to activate the extensions.
> In the tool library the following extensions for mobile cameras are available.

Symbol	Description	Reference
	▪ Ethernet camera element ▪ Placeholder for the image of an Ethernet camera	→ **Use Ethernet camera in the project** (→ p. 116)
	▪ Analogue camera element/item ▪ Placeholder for the image of an analogue camera	→ **Using analogue cameras in the project** (→ p. 120)

8.6.3 Use Ethernet camera in the project

14292

The image data of a connected Ethernet camera is transferred to a placeholder graphic on a visualisation page.

Add Ethernet camera image to the project

435

To add the image data of an Ethernet camera to a project:

Prerequisite

> The Ethernet camera is correctly connected to the device.

> Extension for mobile cameras is activated (→ **Activate extensions for mobile cameras** (→ p. 115))

1 Create visualisation

► Open or newly create visualisation (→ **Add visualisation to the project** (→ p. 76)).

2 Add a placeholder graphic for the camera image

► Select window [ToolBox].

► Select tab [Special controls].

► Drag symbol [Ethernet Camera element] into the visualisation via drag-and-drop.

> Visualisation shows the placeholder for the camera image (= rectangular visualisation element)

Placeholder graphics in frames are not supported!

The placeholder graphic of the camera image is automatically displayed on all visualisation pages of the project.

► To only display the placeholder graphic on certain pages: Create a copy of the placeholder graphic on the previous page and deactivate it by means of variable [Display image], if necessary (→ **Configure Ethernet camera image** (→ p. 117)).

Positioning the placeholder graphic outside the visible area of the visualisation page may cause visualisation problems during the runtime of the application.

► Always position the complete placeholder graphic in the visible area!

If the parameter [Invisible] is activated the other parameter settings are without effect.

► Move the placeholder graphic to the invisible area of the visualisation page to make the camera image invisible.

© ifm electronic gmbh www.ifm.com

Configure Ethernet camera image

14078

To configure the Ethernet camera image:

1 Open configuration dialogue

► Open the visualisation page with placeholder graphic.

► Double-click on placeholder graphic

> Window [Properties] shows configuration options of the camera image.

2 Change position and size of the camera image

► Set the following parameters under [m_StaticPosition]:

Parameter	Description	Possible values
[X]	X coordinate of the top left corner of the camera image	E.g. 290
[Y]	Y coordinate of the top left corner of the camera image	E.g. 220
[Width]	Width of the camera image (in pixels)	Recommended (PAL): 360 Max.: 720
[Height]	Height of the camera image (in pixels)	Recommended (PAL): 288 Max.: 576

3 Set image properties

► Set the following parameters under [Bitmap configuration]:

Parameter	Description	Possible values	
[Static ID]	Assign an alternative placeholder image in the image pool		
[Scale type]	Select the type of image scaling	Isotropic	The image keeps its proportions.
		Anisotropic	The image adapts to the size of the button.
		Not scaled	The image keeps its original size, even if the size of the placeholder is changed.
[Transparent]	Activate/deactivate evaluation of the transparency colour	☐	Do not evaluate transparency colour
		☑	Evaluate transparency colour
[Transparent color]	Select transparency colour		
[Horizontal alignment]	Set horizontal orientation of the camera image	Left	Align to the left
		Centred	Align to the centre
		Right	Align to the right
[Vertical alignment]	Set vertical orientation of the camera image	Top	Align to the top
		Centred	Align to the centre
		Bottom	Align to the bottom

© ifm electronic gmbh www.ifm.com

4 Select an alternative image

► Set the following parameters under [Bild-Variable]:

Parameter	Description	Possible values
[Bild-ID]	▪ Variable for the image from the image collection displayed if no camera image is available ▪ Data type: STRING	E.g. PLC_PRG.sImageNoCam

5 Select variables for scaling and shift

► Set the following parameters under [Move & scale variables]:

Parameter	Description	Possible values
[Absolute movement] > [X]	▪ Variable containing the new X coordinate of the top left corner of the camera image ▪ Data type: INT	E.g. PLC_PRG.iCamNewX
[Absolute movement] > [Y]	▪ Variable containing the new Y coordinate of the top left corner of the camera image ▪ Data type: INT	E.g. PLC_PRG.iCamNewY
[Change of width]	▪ Variable containing the new width of the camera image ▪ Data type: INT	E.g. PLC_PRG.iCamNewWidth
[Change of height]	▪ Variable containing the new height of the camera image ▪ Data type: INT	E.g. PLC_PRG.iCamNewHeight

6 Select state variables

► Set the following parameters under [State variables]:

Parameter	Description	Possible values	
[Invisible]	▪ Variable for the control of the visibility of the camera image ▪ Data type: BOOL	E.g. PLC_PRG.xCamVisible	
		FALSE	Camera image is not visible
		TRUE	Camera image is visible

© ifm electronic gmbh www.ifm.com

7 Select general camera variables

► Set the following parameters under [Common camera variables]:

Parameter	Description	Possible values	
[Display image]	▪ Variable for the control of the display of the camera image ▪ Data type: BOOL	E.g. PLC_PRG.xCamEnable	
		FALSE	Deactivate the camera image
		TRUE	Activate the camera image
[Rotation angle]	▪ Variable for the clockwise rotation of the camera image ▪ Data type: INT	E.g. PLC_PRG.iRotAngle	
		0	No rotation
		90	90°
		180	180°
		170	270°
[Mirror]	▪ Variable for the mirroring of the camera image along its vertical centre axis ▪ Data type: BOOL	E.g. PLC_PRG.xCamMirror	
		FALSE	Do not mirror the camera image
		TRUE	Mirror the camera image
[Error flag]	▪ Variable signals if at least one of the following camera errors occurred: - Invalid angle of rotation - Invalid range - Invalid channel* - Invalid/wrong IP address** ▪ Data type of the variable: BOOL	E.g. PLC_PRG.xErrorFlag	
		FALSE	No error
		TRUE	Error occurred; CODESYS data logger shows error text

Legend:
* ... only for analogue cameras
** ... only for Ethernet cameras

8 Set camera configuration

► Set the following parameters under [Camera configuration]:

Parameter	Description	Possible values	
[Connection ID]	Select camera channel	[ConnToAnCam0]	Channel 0
		[ConnToAnCam1]	Channel 1
		[ConnToAnCam2]	Channel 2
		[ConnToAnCam3]	Channel 3

9 Select Ethernet camera variables

► Set the following parameters under [Ethernet camera variables]:

Parameter	Description	Possible values	
[IP address]	▪ Variable containing the IP address of the Ethernet camera ▪ Data type: STRING	E.g. PLC_PRG.sIPaddress	
[Greyscale mode]	▪ Variable activating/deactivating the scaling mode ▪ Data type: BOOL	E.g. PLC_PRG.xEnableGreyscale	
		FALSE	Greyscale mode deactivated
		TRUE	Greyscale mode active
[Link status]	▪ Variable signals if the camera is connected to the device ▪ Data type: BOOL	E.g. PLC_PRG.xConnStatus	
		FALSE	No error
		TRUE	Error occurred

© ifm electronic gmbh www.ifm.com

8.6.4 Using analogue cameras in the project

20927

The image data of a connected analogue camera is transferred to a placeholder graphic on a visualisation page.

Display options for analogue cameras

21672

The following image resolutions are provided by analogue cameras depending on the colour coding system used:

- PAL: 720 x 576 (aspect ratio: 5:4)
- NTSC: 720 x 480 (aspect ratio: 3:2)

The CR1200 supports the following display modes when analogue cameras are operated:

	Scaling mode (capture mode)	**1:1 mode (overlay mode)**
Description	The image can only be represented as a whole.	▪ A section of the image can be represented up to max. 100 % of the original image. ▪ The centre of the image section is identical with the centre of the original image.
Scalability	Any scaling of the image is possible.	The image cannot be scaled.
Behaviour if scaling is used	Any scaling of the aspect ratio is possible The image representation may be distorted.	The image is represented in the original aspect ratio.
Image repetition rate	Low image repetition rate **Reason: Long processing time!**	High image repetition rate

© ifm electronic gmbh www.ifm.com

Example: Capture mode

9589

The original image can only be scaled in any manner as full-size image, also asymmetrically.

Original image:

Compressed image:

Streched image:

© ifm electronic gmbh

Example: Overlay mode

9560

The image cannot be scaled.
The centre of the image section is identical with the centre of the original image.

Original image:

Add analogue camera image into the project

22075

To add an analogue camera image to a project:

Prerequisite

> The analogue camera is correctly connected to the device.

> Extension for mobile cameras is activated (→ **Activate extensions for mobile cameras** (→ p. 115)).

1 Create visualisation

► Open or newly create visualisation (→ **Create visualisation** (→ p. 110)).

2 Add a placeholder graphic for the camera image

► Select window [ToolBox].

► Select tab [Special controls].

► Drag symbol [Analogue camera element] into the visualisation via drag-and-drop.

> Visualisation shows the placeholder for the camera image (= rectangular visualisation element)

Placeholder graphics in frames are not supported!

The placeholder graphic of the camera image is automatically displayed on all visualisation pages of the project.

► To only display the placeholder graphic on certain pages: Create a copy of the placeholder graphic on the previous page and deactivate it by means of variable [Display image], if necessary (→ **Configure analogue camera image** (→ p. 124)).

Positioning the placeholder graphic outside the visible area of the visualisationpage may cause visualisation problems during the runtime of the application.

► Always position the complete placeholder graphic in the visible area!

If the parameter [Invisible] is activated the other parameter settings are without effect.

► Move the placeholder graphic to the invisible area of the visualisation page to make the camera image invisible.

© ifm electronic gmbh www.ifm.com

Configure analogue camera image

22076

To configure the analogue camera image:

1 Open configuration dialogue

► Open the visualisation page with placeholder graphic.

► Double-click on placeholder graphic

> Window [Properties] shows configuration options of the camera image.

2 Change position and size of the camera image

► Set the following parameters under [m_StaticPosition]:

Parameter	Description	Possible values
[X]	X coordinate of the top left corner of the camera image	E.g. 290
[Y]	Y coordinate of the top left corner of the camera image	E.g. 220
[Width]	Width of the camera image (in pixels)	Recommended (PAL): 360 Max.: 720
[Height]	Height of the camera image (in pixels)	Recommended (PAL): 288 Max.: 576

3 Set image properties

► Set the following parameters under [Bitmap configuration]:

Parameter	Description	Possible values	
[Static ID]	Assign an alternative placeholder image in the image pool		
[Scale type]	Select the type of image scaling	Isotropic	The image keeps its proportions.
		Anisotropic	The image adapts to the size of the button.
		Not scaled	The image keeps its original size, even if the size of the placeholder is changed.
[Transparent]	Activate/deactivate evaluation of the transparency colour	☐	Do not evaluate transparency colour
		☑	Evaluate transparency colour
[Transparent color]	Select transparency colour		
[Horizontal alignment]	Set horizontal orientation of the camera image	Left	Align to the left
		Centred	Align to the centre
		Right	Align to the right
[Vertical alignment]	Set vertical orientation of the camera image	Top	Align to the top
		Centred	Align to the centre
		Bottom	Align to the bottom

© ifm electronic gmbh www.ifm.com

4 Select an alternative image

► Set the following parameters under [Bild-Variable]:

Parameter	Description	Possible values
[Bild-ID]	▪ Variable for the image from the image collection displayed if no camera image is available ▪ Data type: STRING	E.g. PLC_PRG.sImageNoCam

5 Select variables for scaling and shift

► Set the following parameters under [Move & scale variables]:

Parameter	Description	Possible values
[Absolute movement] > [X]	▪ Variable containing the new X coordinate of the top left corner of the camera image ▪ Data type: INT	E.g. PLC_PRG.iCamNewX
[Absolute movement] > [Y]	▪ Variable containing the new Y coordinate of the top left corner of the camera image ▪ Data type: INT	E.g. PLC_PRG.iCamNewY
[Change of width]	▪ Variable containing the new width of the camera image ▪ Data type: INT	E.g. PLC_PRG.iCamNewWidth
[Change of height]	▪ Variable containing the new height of the camera image ▪ Data type: INT	E.g. PLC_PRG.iCamNewHeight

6 Select state variables

► Set the following parameters under [State variables]:

Parameter	Description	Possible values	
[Invisible]	▪ Variable for the control of the visibility of the camera image ▪ Data type: BOOL	E.g. PLC_PRG.xCamVisible	
		FALSE	Camera image is not visible
		TRUE	Camera image is visible

© ifm electronic gmbh www.ifm.com

7 Select general camera variables

► Set the following parameters under [Common camera variables]:

Parameter	Description	Possible values	
[Display image]	▪ Variable for the control of the display of the camera image ▪ Data type: BOOL	E.g. PLC_PRG.xCamEnable	
		FALSE	Deactivate the camera image
		TRUE	Activate the camera image
[Rotation angle]	▪ Variable for the clockwise rotation of the camera image ▪ Data type: INT	E.g. PLC_PRG.iRotAngle	
		0	No rotation
		90	90°
		180	180°
		170	270°
[Mirror]	▪ Variable for the mirroring of the camera image along its vertical centre axis ▪ Data type: BOOL	E.g. PLC_PRG.xCamMirror	
		FALSE	Do not mirror the camera image
		TRUE	Mirror the camera image
[Error flag]	▪ Variable signals if at least one of the following camera errors occurred: - Invalid angle of rotation - Invalid range - Invalid channel* - Invalid/wrong IP address** ▪ Data type of the variable: BOOL	E.g. PLC_PRG.xErrorFlag	
		FALSE	No error
		TRUE	Error occurred; CODESYS data logger shows error text

Legend:
* ... only for analogue cameras
** ... only for Ethernet cameras

8 Set camera configuration

► Set the following parameters under [Camera configuration]:

Parameter	Description	Possible values	
[Connection ID]	Select camera channel	[ConnToAnCam0]	Channel 0

9 Select analogue camera variables

► Set the following parameters under [Analoge Kameravariablen]:

Parameter	Description	Possible values	
[Input channel]	▪ Variable containing the input channel of the requested analogue camera ▪ Data type: INT	E.g. PLC_PRG.iCamChan	
		0	Channel 1
		1	Channel 2
[Scaling mode]	▪ Variable activating/deactivating the scaling mode ▪ Data type: BOOL	E.g. PLC_PRG.xEnableScaleMode	
		FALSE	Scaling mode deactivated
		TRUE	Scaling mode active

8.7 Use CANopen

Contents

CANopen: Send and receive SDO 128
CANopen: Network Management (NMT) 128

13902

- ► Observe the notes about task classification! (→ **Configure task processing** (→ p. 131))
- ► Observe the notes about CANopen! (→ System manual)

The following POUs are available to access a CAN interface configured for CANopen operation in an application.

Prerequisites

> Device configured as CANopen Manager (master) (→ **CANopen: Configure CANopen Manager (master)** (→ p. 89)).

© ifm electronic gmbh www.ifm.com

8.7.1 CANopen: Send and receive SDO

7344

The following POUs are available to send or receive Service Data Objects (SDO):

Name	Description	Reference
COP_SDOread	Read Service Data Object (SDO)	→ **COP_SDOread** (→ p. 149)
COP_SDOwrite	Write Service Data Object (SDO	→ **COP_SDOwrite** (→ p. 151)

8.7.2 CANopen: Network Management (NMT)

7343

The following POUs are available for the management of the CANopen network:

Name	Description	Reference
COP_GetNodeState	Request state of one or several CANopen devices	→ ***COP_GetNodeState*** (→ p. 147)
COP_SendNMT	Send NMT control command to a CANopen device	→ **COP_SendNMT** (→ p. 153)

© ifm electronic gmbh www.ifm.com

8.8 Use RawCAN (CAN Layer 2)

Contents

RawCAN: Control CAN network nodes 130
RawCAN: Send and receive CAN messages....130
RawCAN: Request and send remote CAN messages 130

9726

The following POUs are available to access a CAN interface configured for CANopen operation in an application.

Prerequisites

> CAN interface is configured for operation as RawCAN (CAN Layer 2) (→ **Configure CAN interfaces** (→ p. 87)).

► Observe the notes about task configuration! (→ **Configure task processing** (→ p. 131))

© ifm electronic gmbh

8.8.1 RawCAN: Control CAN network nodes

21776

The following POUs are available to control a node in a CAN network:

Name	Description	Reference
CAN_Enable	Activate CAN node	→ CAN_Enable (→ p. 226)
CAN_Recover	Reboot CAN node	→ CAN_Recover (→ p. 228)

8.8.2 RawCAN: Send and receive CAN messages

21777

The following POUs are available to send or receive messages in a CAN network:

Name	Description	Reference
CAN_Rx	Receive CAN message	→ CAN_Rx (→ p. 234)
CAN_RxMask	Receive CAN messages	→ CAN_RxMask (→ p. 236)
CAN_RxRange	Receive CAN messages	→ CAN_RxRange (→ p. 239)
CAN_Tx	Send CAN message	→ CAN_Tx (→ p. 242)

8.8.3 RawCAN: Request and send remote CAN messages

21778

The following POUs are available to request remote messages in a CAN network or to send replies to a remote request:

Name	Description	Reference
CAN_RemoteRequest	Send request for a remote message	→ CAN_RemoteRequest (→ p. 230)
CAN_RemoteResponse	Reply to the request of a remote message	→ CAN_RemoteResponse (→ p. 232)

© ifm electronic gmbh www.ifm.com

8.9 Configure task processing

Contents

Configure main task....132
Configure visualisation task....132

11406

► Familiarise yourself with the following CODESYS functions!
  - Task configuration:
    → Online help > CODESYS Development System > Program application > Task configuration

The processing of the tasks is controlled by parameters.The user can set the parameters of the tasks separately.

CODESYS automatically creates the following tasks during project and visualisation creation:

Name	Description	Reference
MainTask	Task for the processing of the main program [PLC_PRG (PRG)]	→ **Configure main task** (→ p. 132)
VISU_TASK	Task for the processing of the visualisations	→ **Configure visualisation task** (→ p. 132)

For subprograms with POUs to be executed several times per PLC cycle:

► Create new task.

► Configure task properties:
1. [Type]: Cyclical
2. [Interval]: Requested cycle time

► Assign subprogram with POUs to the newly created task.

If the CAN buses are heavily utilised:

► Create an individual task for each CAN interface.

► Configure task properties:
1. [Priority]: High (< 5)
2. [Type]: Cyclical
3. [Interval]: requested cycle time (=transmission interval)

► Assign subprograms with the POUs for CAN communication to the CAN tasks.

© ifm electronic gmbh

8.9.1 Configure main task

22074

The main task controls the execution of the standard program PLC_PRG. The programmer can assign additional subprograms to the main task.

To set the properties of the main task:

► In the device tree: Double-click on [MainTask]

> In the editor window: Tab [Configuration] shows current configuration of the visualisation task.

► Set the following values:
1. [Priority (0...31)]: Default setting or > Priority of the CAN tasks
2. [Type]: Cyclical
3. [Interval]: t#20ms

► Save the project to apply changes.

8.9.2 Configure visualisation task

3523

Each visualisation is executed separately from the program code in a separate task.

To set the properties of the visualisation task:

► In the device tree: Double-click on [VISU_TASK]

> In the editor window: Tab [VISU_TASK] > [Configuration] shows current configuration of the visualisation task.

► Set the following values:
1. [Priority (0...31)]: <16
2. [Type]: Cyclical
3. [Interval]: t#20ms

► Assign a priority that is as low as possible to the visualisation task ([VISU_TASK]) to avoid interruption of other tasks that are important for the core functions of the application.

► Execute the VISU_TASK in appropriate cyclic intervals to save the resources of the device-internal PLC and the fieldbus network.

► Save the project to apply changes.

9.1 Transfer CODESYS project to the device

Contents

Load application to CR1200 136
Delete application from the device 136

14059

- ► Familiarise yourself with the following CODESYS functions!
  - Transfer application to the device
    → Online help > CODESYS Development System > Transfer application to the PLC
  - Monitoring
    → Online help > CODESYS Development System > Application during the runtime > Monitoring of values
- ► Observe the notes about the states of the PLC application!
  → **Operating states of the PLC application** (→ p. 137)

© ifm electronic gmbh www.ifm.com

9.1.1 Load application to CR1200

12330

To load the created application to the device and store it non-volatilely:

Prerequisites:

> Connection between PC/laptop and CR1200 established.
> Communication path has been set (→ **Set communication path of PLC** (→ p. 78)).
> Project has been tested.

1 Translate application

► In the project tree: Click on [Application].
► Select [Build] > [Build].
> CODESYS creates program code of the application.

2 Upload application to the device

► Select [Online] > [Login].
> CODESYS changes to the online mode.
> CODESYS loads active application to the device (download).
> Application on the device is in the STOP state.

3 Start application

► Select [Debug] > [Start].
> Application on the device changes to the RUN state.

4 Create boot application

► Select [Online] > [Create boot application].
> CODESYS stores the application non-volatilely on the device.

9.1.2 Delete application from the device

12418

To delete an application stored on the device:

1 Connect with the device

► In the device tree: Click on [Application].
► Select [Online] > [Login].
> CODESYS changes to the online mode.

2 Delete application

► In the device tree: Double-click on [Device (CR1200)]
> Editor window shows device settings.
► Select tab [Applications].
► Click on [Liste aktualisieren].
> Editor window shows the applications stored on the device.
► Click on [Remove All] to delete all applications.
OR:
Select requested application and click on [Remove] to delete individual applications.
> CODESYS deletes the selected applications from the device.

© ifm electronic gmbh www.ifm.com

9.2 Operating states of the PLC application

Contents

Display operating mode of the PLC application 137
Start PLC application 138
Stop PLC application 138

2688

The applications stored on the CR1200 are executed independently from each other in separate tasks. An application can have the following operating states:

- **Unload**
  No application is stored on the device.
- **RUN**
  – The application is stored on the device.
  – The application is processed cyclically.
- **STOP**
  – The application is stored on the device.
  – The application is not processed.

9.2.1 Display operating mode of the PLC application

19910

To display the current operating status of the PLC application stored on the device:

> In the device tree: Symbol [Application] shows the current status

OR:

> In the online mode: CODESYS status bar shows the current state of the application.

© ifm electronic gmbh

9.2.2 Start PLC application

19929

To start the execution of the PLC application:

► In the device tree: Right-click on [Application] and select [Aktive Applikation setzen].
► Select [Online] > [Login].
> CODESYS changes to the online mode.
► Select [Debug] > [Starten].
> Application changes to the RUN state (→ **Operating states of the PLC application** (→ p. 137)).
► Optional: Repeat process for further applications.

9.2.3 Stop PLC application

19909

To stop the execution of the PLC application:

► In the device tree: Right-click on [Application] and select [Aktive Applikation setzen].
► Select [Online] > [Login].
> CODESYS changes to the online mode.
► Select [Debug] > [Stop].
> Application changes to the STOP state (→ **Operating states of the PLC application** (→ p. 137)).
► Optional: Repeat process for further applications.

9.3 Reset

Contents

Supported reset variants 140
Reset application (warm) 140
Reset application (cold) 141
Reset application (origin) 141

18025

© ifm electronic gmbh www.ifm.com

9.3.1 Supported reset variants

18613

The following table shows the reset variants supported by the device-internal CODESYS PLC and the resulting system behaviour:

Type of reset	System behaviour	Triggering actions
Reset (warm)	▪ application goes to STOP state. ▪ Standard variables (VAR) of the application are initialised. ▪ Remanent variables (VAR RETAIN) of the application keep their current values.	→ **Reset application (warm)** (→ p. 140)
Reset (cold)	▪ application changes to the STOP state. ▪ All variables (VAR, VAR RETAIN) of the application are initialised.	→ **Reset application (cold)** (→ p. 141)
Reset (default)	▪ application goes to STOP state. ▪ The application on the PLC is deleted. ▪ All variables (VAR, VAR RETAIN) of the application are initialised. ▪ PLC is reset to the default state.	→ **Reset application (origin)** (→ p. 141)

A variable that has been declared without an initialisation value is initialised with the variable-specific standard value (e.g. `INT = 0`).

9.3.2 Reset application (warm)

7233

To reset the application:

► In the device tree: Select [Application] and select
► [Online] > [Login] as active application.
> CODESYS changes to the online mode.
► Select [Online] > [Reset warm] to reset the application.
> Application changes to the STOP state.
> Standard variables are newly initialised.
> Retain variables keep their values.

© ifm electronic gmbh www.ifm.com

9.3.3 Reset application (cold)

7230

To reset the application:

► In the device tree: Select [Application].
► Select [Online] > [Login].
> CODESYS changes to the online mode.
► Select [Online] > [Reset cold] to reset the application.
> Application changes to the STOP state.
> All variables are newly initialised

9.3.4 Reset application (origin)

22672

To reset the application:

► In the device tree: Select [Application].
► Select [Online] > [Login].
> CODESYS changes to the online mode.
► Select [Online] > [Reset origin] to reset the application.
> Application changes to the STOP state and is deleted.
> All variables are newly initialised
> PLC is reset to the original state.

© ifm electronic gmbh www.ifm.com

9.4 Display system information

14161

In the online mode the device tree displays the current values of the following system parameters:

Parameter	Description	Possible values
[IP Settings]	IP settings	--
▪ [IP Address]	IP address of the device	E.g. 192.168.0.100
▪ [IP Mask]	Subnet mask of the network	E.g. 255.255.255.0
▪ [Gateway Address]	IP address of the network gateway	E.g. 192.168.0.2
[Version Firmware]	Version of the installed firmware	E.g. V1.4.0
[Serial Number Device]	Serial number of the device	E.g. 1511AB019

To display the system information of the device:

► Establish connection between CODESYS and CR1200.
► Select [Online] > [Login].
► CODESYS changes to the online mode.
► In the device tree: Double-click on [System_Info]
► In the editor window: Select tab [Parameter].
> In the editor window: Table shows current values of the system parameters.

10.1 Address assignment in Ethernet networks

14436

In the Ethernet network every IP address MUST be unique.

The following IP addresses are reserved for network-internal purposes and are therefore not allowed as an address for participants: nnn.nnn.nnn.0 | nnn.nnn.nnn.255.

Only network participants whose subnet mask is identical and whose IP addresses are identical with respect to the subnet mask can communicate with each other.

Rule:
If part of the subnet mask = 255, the corresponding IP address parts must be identical.
If part of the subnet mask = 0, the corresponding IP address parts must be different.

If the subnet mask = 255.255.255.0, 254 participants communicating with each other are possible in the network.
If the subnet mask = 255.255.0.0, 256x254 = 65 024 participants communicating with each other are possible in the network.

In the same physical network different subnet masks of the participants are allowed. They form different groups of participants which cannot communicate with groups of participants having other subnet masks.

In case of doubt or problems please contact your system administrator.

Examples:

Participant A IP address	Participant A Subnet mask	Participant B IP address	Participant B Subnet mask	Communication of participants possible?
192.168.82.247	255.255.255.0	192.168.82.10	255.255.255.0	Yes, 254 participants possible
192.168.82.**247**	255.255.255.0	192.168.82.**247**	255.255.255.0	No (same IP address)
192.168.82.247	255.255.**255**.0	192.168.82.10	255.255.**0**.0	No (different subnet mask)
192.168.**82**.247	255.255.255.0	192.168.**116**.10	255.255.255.0	No (different IP address range: 82 vs. 116)
192.168.222.213	255.255.0.0	192.168.222.123	255.255.0.0	Yes, 65 024 participants possible
192.168.111.213	255.255.0.0	192.168.222.123	255.255.0.0	Yes, 65 024 participants possible
192.168.82.247	255.255.255.0	192.168.82.**0**	255.255.255.0	No; the whole network is disturbed because the IP address xxx.xxx.xxx.0 is not allowed

10.2.1 Bibliothek ifmCANopenManager.library

Contents

COP_GetNodeState 147
COP_SDOread 149
COP_SDOwrite 151
COP_SendNMT 153
NMT_SERVICE (ENUM) 155
NMT_STATES (ENUM) 155

18443

The library contains program blocks (POU) and data structures for the programming of the functionality of a CANopen Manager.

© ifm electronic gmbh www.com

COP_GetNodeState

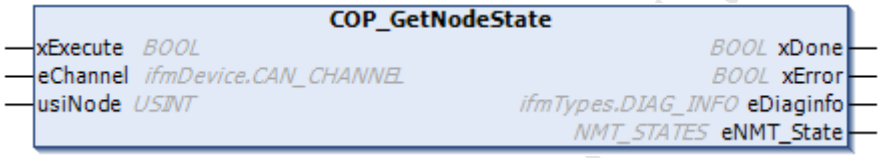

15956

Function block type: Function block (FB)

Behaviour model: EXECUTE

Library: ifmCANopenManager.library

Symbol in CODESYS:

Description

18445

The FB indicates the current state of a CANopen node.

Input parameter

18446

Parameter	Data type	Description	Possible values	
xExecute	BOOL	Control execution of the FB	FALSE ⇨ TRUE	FB is executed once
			Other	No impact on FB processing
eChannel	CAN_ CHANNEL	Identifier of the CAN Interface	→ **CAN_CHANNEL (ENUM)** (→ p. 157)	
usiNode	USINT	ID of the CANopen node	0	Local device
			1 ... 127	ID of the CANopen node

© ifm electronic gmbh

Output parameter

18447

Parameter	Data type	Description	Possible values	
xDone	BOOL	Indication of whether execution of the FB has been successfully completed	FALSE	FB is executed
			TRUE	▪ FB successfully executed ▪ FB can be called again
xError	BOOL	Indication if an error occurred during the FB execution	FALSE	No error occurred or the FB is still being executed
			TRUE	▪ Error occurred ▪ Action could not be executed ▪ Note diagnostic information
eDiagInfo	DIAG_INFO	Diagnostic information	→ List below (diagnostic codes:)	
eNMT_State	NMT_ STATES	State of the CANopen node	→ **NMT_STATES (ENUM)** (→ p. 155)	

Diagnostic codes:

- STAT_INACTIVE — State: FB/Function is inactive.
- STAT_BUSY — State: FB/Function is currently executed.
- STAT_DONE — State: FB/Function has been successfully executed and completed. There are valid results on the outputs.
- ERR_INTERNAL — Error: Internal system error
  ► Contact the ifm Service Center!
- ERR_INVALID_VALUE — Error: at least 1 invalid input parameter or invalid combination of input parameters; Function call has been stopped.
- ERR_BUS_OFF — Error: CAN interface is in the "BUS OFF" state
- ERR_COMMUNICATION — Error: no Connection to the bus user or bus user not available

© ifm electronic gmbh www.ifm.com

COP_SDOread

18448

Function block type: Function block (FB)

Behaviour model: EXECUTE

Library: ifmCANopenManager.library

Symbol in CODESYS:

Description

7144

The FB reads the contents of a Service Data Object (SDO) and writes them into a buffer storage. The SDO is selected via the CAN interface, the ID of the CANopen node, as well as index and subindex of the object directory.

The CANopen node has to reply to the request of the FB within a period of time defined by the user.

Input parameter

YS_OBJECTID>

Parameter	Data type	Description	Possible values	
xExecute	BOOL	Control execution of the FB	FALSE ⇨ TRUE	FB is executed once
			Other	No impact on FB processing
eChannel	CAN_ CHANNEL	Identifier of the CAN Interface	→ **CAN_CHANNEL (ENUM)** (→ p. 157)	
usiNode	USINT	ID of the CANopen node	0	Local device
			1 ... 127	ID of the CANopen node
uiIndex	UINT	Index in the object directory		
usiSubIndex	USINT	Subindex of the index in the object directory		
pData	Pointer to USINT	Pointer on buffer storage		
udiBuffLen	UDINT	Size of the buffer storage (in byte)		
tTimeout	TIME	Max. response time	E.g. `T#25ms`	

© ifm electronic gmbh

Output parameter

11271

Parameter	Data type	Description	Possible values	
xDone	BOOL	Indication of whether execution of the FB has been successfully completed	FALSE	FB is executed
			TRUE	▪ FB successfully executed ▪ FB can be called again
xError	BOOL	Indication if an error occurred during the FB execution	FALSE	No error occurred or the FB is still being executed
			TRUE	▪ Error occurred ▪ Action could not be executed ▪ Note diagnostic information
eDiagInfo	DIAG_INFO	Diagnostic information	→ List below (diagnostic codes:)	
udiLen	UDINT	Number of received bytes		

Diagnostic codes:

- STAT_INACTIVE — State: FB/Function is inactive.
- STAT_DONE — State: FB/Function has been successfully executed and completed. There are valid results on the outputs.
- ERR_INACTIVE_INTERFACE — Error: Selected CAN channel is deactivated.
- ERR_BUFFER_OVERFLOW — Error: Transmission buffer full; CAN message cannot write to buffer storage and is not transmitted
- ERR_INVALID_VALUE — Error: at least 1 invalid input parameter or invalid combination of input parameters; Function call has been stopped.
- ERR_INTERNAL — Error: Internal system error
  ► Contact the ifm Service Center!

© ifm electronic gmbh www.ifm.com

COP_SDOwrite

17128

Function block type: Function block (FB)

Behaviour model: EXECUTE

Library: ifmCANopenManager.library

Symbol in CODESYS:

Description

19833

The FB writes the contents of a Service Data Object (SDO). The SDO is selected via the CAN interface, the ID of the CANopen node, as well as index and subindex of the object directory.

Input parameter

SYS_OBJECTID>

Parameter	Data type	Description	Possible values	
xExecute	BOOL	Control execution of the FB	FALSE ⇨ TRUE	FB is executed once
			Other	No impact on FB processing
eChannel	CAN_ CHANNEL	Identifier of the CAN Interface	→ **CAN_CHANNEL (ENUM)** (→ p. 157)	
usiNode	USINT	ID of the CANopen node	0	Local device
			1 ... 127	ID of the CANopen node
uiIndex	UINT	Index in the object directory		
usiSubIndex	USINT	Subindex of the index in the object directory		
pData	Pointer to USINT	Pointer on buffer storage		
udiLen	UDINT	Number of received bytes		
tTimeout	TIME	Max. response time	E.g. `T#25ms`	

© ifm electronic gmbh

Output parameter

7005

Parameter	Data type	Description	Possible values	
xDone	BOOL	Indication of whether execution of the FB has been successfully completed	FALSE	FB is executed
			TRUE	▪ FB successfully executed ▪ FB can be called again
xError	BOOL	Indication if an error occurred during the FB execution	FALSE	No error occurred or the FB is still being executed
			TRUE	▪ Error occurred ▪ Action could not be executed ▪ Note diagnostic information
eDiagInfo	DIAG_INFO	Diagnostic information	→ List below (diagnostic codes:)	

Diagnostic codes:

- STAT_INACTIVE — State: FB/Function is inactive.
- STAT_DONE — State: FB/Function has been successfully executed and completed. There are valid results on the outputs.
- ERR_INACTIVE_INTERFACE — Error: Selected CAN channel is deactivated.
- ERR_BUFFER_OVERFLOW — Error: Transmission buffer full; CAN message cannot write to buffer storage and is not transmitted
- ERR_INVALID_VALUE — Error: at least 1 invalid input parameter or invalid combination of input parameters; Function call has been stopped.
- ERR_INTERNAL — Error: Internal system error
  ► Contact the ifm Service Center!

© ifm electronic gmbh www.ifm.com

COP_SendNMT

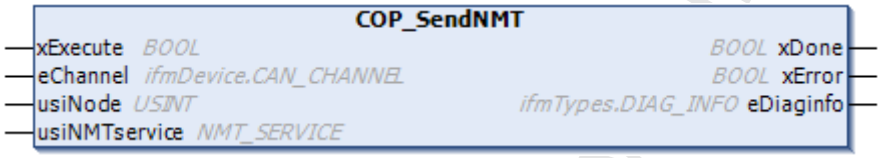

7006

Function block type: Function block (FB)

Behaviour model: EXECUTE

Library: ifmCANopenManager.library

Symbol in CODESYS:

Description

7001

The FB sends a command for the control of a CANopen node.

Input parameter

6981

Parameter	Data type	Description	Possible values	
xExecute	BOOL	Control execution of the FB	FALSE ⇨ TRUE	FB is executed once
			Other	No impact on FB processing
eChannel	CAN_ CHANNEL	Identifier of the CAN Interface	→ **CAN_CHANNEL (ENUM)** (→ p. 157)	
usiNode	USINT	ID of the CANopen node	0	Local device
			1 ... 127	ID of the CANopen node
usiNMTservice	NMT_ SERVICE	Command for the control of a CANopen node	→ **NMT_SERVICE (ENUM)** (→ p. 155)	

© ifm electronic gmbh

Output parameter

7147

Parameter	Data type	Description	Possible values	
xDone	BOOL	Indication of whether execution of the FB has been successfully completed	FALSE	FB is executed
			TRUE	▪ FB successfully executed ▪ FB can be called again
xError	BOOL	Indication if an error occurred during the FB execution	FALSE	No error occurred or the FB is still being executed
			TRUE	▪ Error occurred ▪ Action could not be executed ▪ Note diagnostic information
eDiagInfo	DIAG_INFO	Diagnostic information	→ List below (diagnostic codes:)	

Diagnostic codes:

- STAT_INACTIVE — State: FB/Function is inactive.
- STAT_DONE — State: FB/Function has been successfully executed and completed. There are valid results on the outputs.
- ERR_INACTIVE_INTERFACE — Error: Selected CAN channel is deactivated.
- ERR_BUFFER_OVERFLOW — Error: Transmission buffer full; CAN message cannot write to buffer storage and is not transmitted
- ERR_INVALID_VALUE — Error: at least 1 invalid input parameter or invalid combination of input parameters; Function call has been stopped.
- ERR_INTERNAL — Error: Internal system error

NMT_SERVICE (ENUM)

7132

Name	Description	Possible values		Data type	Value
NMT_SERVICE	Command for the control of a CANopen node	INIT_NODE	Initiate CAN node	INT	0
		SET_PRE_OPERATIONAL	Set preoperational state	INT	1
		SET_OPERATIONAL	Set operational state	INT	2
		RESET_NODE	Reset CAN node	INT	3
		RESET_COMM	Reset communication	INT	4
		STOP_NODE	Stop CAN node	INT	5

NMT_STATES (ENUM)

18496

Name	Description	Possible values		Data type	Value
NMT_STATES	State of the CAN network	INIT	Initialisation	INT	0
		PREOP	Preopertional	INT	1
		OPERATIONAL	Operational	INT	2
		STOP	STOP	INT	3
		NOT_AVAILABLE	Not available	INT	4
		UNKNOWN	Unknown	INT	5

CAN_CHANNEL (ENUM)

17131

Name	Description	Possible values		Data type	Value
CAN_CHANNEL	Identifier of the CAN Interface	CHAN_0	CAN interface 0	INT	0
		CHAN_1	CAN interface 1	INT	1
		CHAN_2	CAN interface 2	INT	2
		CHAN_3	CAN interface 3	INT	3

CAN_BAUDRATE (ENUM)

18519

Name	Description	Possible values		Data type	Value
CAN_BAUDRATE	Data transfer rate of the CAN interface	KBAUD_125	125 kilobaud	INT	125
		KBAUD_250	250 kilobaud	INT	250
		KBAUD_500	500 kilobaud	INT	500
		KBAUD_800	800 kilobaud	INT	800
		KBAUD_1000	1000 kilobaud	INT	1000

LED_COLOUR (ENUM)

14622

Name	Description	Possible values		Data type	Value
LED_COLOUR	Colour of the LED (RGB code)	BLACK (OFF)	Off	WORD	0x000000
		WHITE	White	WORD	0xFFFFFF
		RED	Red	WORD	0xFF0000
		GREEN	Green	WORD	0x00FF00
		BLUE	Blue	WORD	0x0000FF
		YELLOW	Yellow	WORD	0xFFFF00
		ORANGE	Orange	WORD	0xFF5A00
		MAGENTA	Magenta	WORD	0xFF00FF
		CYAN	Cyan	WORD	0x00FFFF

LED_FLASH_FREQ (ENUM)

21318

Name	Description	Possible values		Data type	Value
LED_FLASH_FREQ	Flashing frequency of the status LED	FRQ_0Hz	Off	INT	0
		FRQ_05Hz	0,5 Hz	INT	1
		FRQ_1Hz	1 Hz	INT	2
		FRQ_2Hz	2 Hz	INT	3
		FRQ_5Hz	5 Hz	INT	4

IOchannel (GVL)

21327

Name	Description	Data type	Value
usiVBB30	Voltage supply, terminal 30	UINT	0
usiVBB15	Voltage supply, terminal 15	UINT	1

CANconstants (GVL)

20936

Name	Description	Data type	Value
usiNumberCANitf	Number of the CAN interfaces of the devices	UINT	4

SysInfo (GVL)

20937

Name	Description	Data type	Value
usiNumberOfSysInfo	Number of system components of the device	USINT	8
aSysInfoList	Variable with list of the system components (→ **aSysInfoList (GVL)** (→ p. 248))	ARRAY[0..8] OF **SysInfoStruct (STRUCT)** (→ p. 158)	

SysInfoStruct (STRUCT)

21317

Designation	Data type	Description	Possible values
eInfoType	INFO_TYPE	System component	E.g. FIRMWARE_DEVICE
sValue	STRING (255)	Value of the system component	E.g. 3.1
sName	STRING (32)	Name of the system component	E.g. FW Device

10.2.3 Bibliothek ifmEthernet.library

Contents

GetIPsettings 160
SetIPsettings 162
stIPv4Setting (STRUCT) 164

21213

The library contains program blocks (POU) and data structures for the management of the IP settings of the device.

© ifm electronic gmbh

GetIPsettings

11473

Function block type: Function block (FB)

Behaviour model: EXECUTE

Library: ifmEthernet.library

Symbol in CODESYS:

Description

21209

The FB reads the following IP settings of the device:

- IP address
- Network mask of the TCP/IP network as well as
- IP address of the gateway
- DHCP status

The FB provides the read values in a complex variable of the "stIPv4Setting" type.

Input parameter

21203

Parameter	Data type	Description	Possible values	
xExecute	BOOL	Control execution of the FB	FALSE ⇨ TRUE	FB is executed once
			Other	No impact on FB processing

© ifm electronic gmbh

Output parameter

21208

Parameter	Data type	Description	Possible values	
xDone	BOOL	Indication of whether execution of the FB has been successfully completed	FALSE	FB is executed
			TRUE	▪ FB successfully executed ▪ FB can be called again
xError	BOOL	Indication if an error occurred during the FB execution	FALSE	No error occurred or the FB is still being executed
			TRUE	▪ Error occurred ▪ Action could not be executed ▪ Note diagnostic information
eDiagInfo	DIAG_INFO	Diagnostic information	→ List below (diagnostic codes:)	
stIPv4Setting	stIPv4Setting	IPv4 settings of the device	→ **stIPv4Setting (STRUCT)** (→ p. 164)	

Diagnostic codes:

- STAT_DISABLE — FB/Function is disabled
- STAT_BUSY — State: FB/Function is currently executed.
- STAT_DONE — State: FB/Function has been successfully executed and completed. There are valid results on the outputs.
- ERR_NOT_SUPPORTED — Error: Invalid function calls; Function is not supported.
- ERR_INTERNAL — Error: Internal system error
  ► Contact the ifm Service Center!
- ERR_INVALID_CHANNEL — Error: Internal parameter setting fault
  ► Contact the ifm Service Center!
- ERR_UNDEFINED — Error: Unknown error
  ► Contact the ifm Service Center!

© ifm electronic gmbh www.ifm.com

SetIPsettings

13779

Function block type: Function block (FB)

Behaviour model: EXECUTE

Library: ifmEthernet.library

Symbol in CODESYS:

Description

21216

The FB changes the following IP settings of the device:

- IP address
- Subnet mask of the TCP/IP network
- IP address of the gateway
- DHCP status

The IP settings are transferred to the FB in a complex variable of the "stIPv4Setting" type.

The parameter DHCP has the highest priority. If DHCP = TRUE the values of the parameters IP address, subnet mask and gateway address are not evaluated.

After the call, the FB checks if DHCP is activated. If yes, the FB deactivates the DHCP client of the device and sets the required IP address.

► Enter the IP address using the following notation out the leading zeros when entering the IP address!
FALSE: `192.168.000.055`
CORRECT: `192.168.0.55`

Within a application only one instance of the FB may be active at a time.

► Call only one instance of the FB within a application!

Each call of the FB executes a write operation on the device-internal FLASH memory.

► Do not call FB cyclically!

Input parameter

21215

Parameter	Data type	Description	Possible values	
xExecute	BOOL	Control execution of the FB	FALSE ⇨ TRUE	FB is executed once
			Other	No impact on FB processing
stIPv4Setting	stIPv4Setting	IPv4 settings of the device	→ **stIPv4Setting (STRUCT)** (→ p. 164)	

© ifm electronic gmbh www.ifm.com

Output parameter

21217

Parameter	Data type	Description	Possible values	
xDone	BOOL	Indication of whether execution of the FB has been successfully completed	FALSE	FB is executed
			TRUE	▪ FB successfully executed ▪ FB can be called again
xError	BOOL	Indication if an error occurred during the FB execution	FALSE	No error occurred or the FB is still being executed
			TRUE	▪ Error occurred ▪ Action could not be executed ▪ Note diagnostic information
eDiagInfo	DIAG_INFO	Diagnostic information	→ List below (diagnostic codes:)	

Diagnostic codes:

- STAT_DISABLE — FB/Function is disabled
- STAT_BUSY — State: FB/Function is currently executed.
- STAT_DONE — State: FB/Function has been successfully executed and completed. There are valid results on the outputs.
- ERR_NOT_SUPPORTED — Error: Invalid function calls; Function is not supported.
- ERR_INTERNAL — Error: Internal system error
  ► Contact the ifm Service Center!
- ERR_INVALID_CHANNEL — Error: Internal parameter setting fault
  ► Contact the ifm Service Center!
- ERR_INVALID_VALUE — Error: at least 1 invalid input parameter or invalid combination of input parameters; Function call has been stopped.
- ERR_UNDEFINED — Error: Unknown error
  ► Contact the ifm Service Center!

Copy_PDM_To_USB

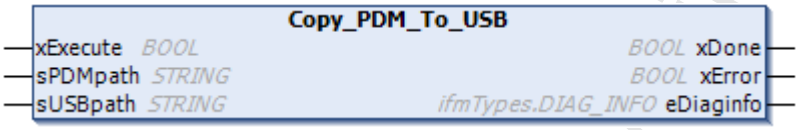

21645

Function block type: Function block (FB)

Behaviour model: EXECUTE

Library: ifmFileUtil.library

Symbol in CODESYS:

Description

21646

The FB copies one or several files from a source directory on the device to a destination directory on an USB memory device.

The FB uses the Linux command "cp -rf <sPDMpath> <sUSBpath>".

Input parameter

21647

Parameter	Data type	Description	Possible values	
xExecute	BOOL	Control execution of the FB	FALSE ⇨ TRUE	FB is executed once
			Other	No impact on FB processing
sPDMpath	STRING	Source directory / file on the device whose contents are to be copied	E.g. `/data/tmp`	
sUSBpath	STRING	Target directory on the USB memory device into which the files are to be copied ▪ Enter the directory as relative path to the mount point of the USB device. ▪ Example: `/backup` copies the data selected to the directory `/mnt/USB/backup`	E.g. `/backup`	

© ifm electronic gmbh www.ifm.com

There are the following options for file selection:

- Individual files (e. g. /home/values/sample.csv)
- Several files by means of wildcards (e. g. /home/values/*.csv)
- All files of a directory (e. g. /home/values/)

The following combinations of source and target indications are valid:

- Values for source and target differ and both are folders
- Values for source and target differ and both are files
- Value for source is file and value for target is folder

The following combinations of source and target indications are invalid and cause an error message:

- No values for source and/or target
- Value for source is folder and value for target is file
- Values for source and/or target contain subsequent "/" (e. g. /home/values///file.csv)
- Values for source and target are identical (file and folder)

Output parameter

21648

Parameter	Data type	Description	Possible values	
xDone	BOOL	Indication of whether execution of the FB has been successfully completed	FALSE	FB is executed
			TRUE	▪ FB successfully executed ▪ FB can be called again
xError	BOOL	Indication if an error occurred during the FB execution	FALSE	No error occurred or the FB is still being executed
			TRUE	▪ Error occurred ▪ Action could not be executed ▪ Note diagnostic information
eDiagInfo	DIAG_INFO	Diagnostic information	→ List below (diagnostic codes:)	

Diagnostic codes:

- STAT_INACTIVE — State: FB/Function is inactive.
- STAT_BUSY — State: FB/Function is currently executed.
- STAT_DONE — State: FB/Function has been successfully executed and completed. There are valid results on the outputs.
- ERR_NOT_SUPPORTED — Error: Invalid function calls; Function is not supported.
- ERR_INVALID_VALUE — Error: at least 1 invalid input parameter or invalid combination of input parameters; Function call has been stopped.
- ERR_INTERNAL — Error: Internal system error
  ► Contact the ifm Service Center!
- ERR_UNDEFINED — Error: Unknown error
  ► Contact the ifm Service Center!

SyncFileMemory

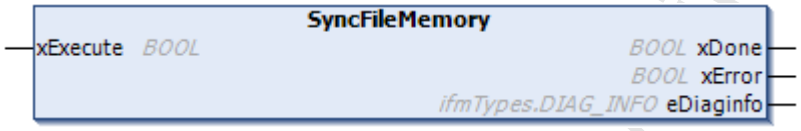

21667

Function block type: Function block (FB)

Behaviour model: EXECUTE

Library: ifmFileUtil.library

Symbol in CODESYS:

Description

21668

The FB synchronises the NAND flash memory with the working memory (RAM) of the device.

► Carry out the FB as last operation before shutting down the device!

The FB uses the Linux command "sync".

Input parameter

21669

Parameter	Data type	Description	Possible values	
xExecute	BOOL	Control execution of the FB	FALSE ⇨ TRUE	FB is executed once
			Other	No impact on FB processing

© ifm electronic gmbh www.ifm.com

Output parameter

21670

Parameter	Data type	Description	Possible values	
xDone	BOOL	Indication of whether execution of the FB has been successfully completed	FALSE	FB is executed
			TRUE	▪ FB successfully executed ▪ FB can be called again
xError	BOOL	Indication if an error occurred during the FB execution	FALSE	No error occurred or the FB is still being executed

ReadCSV8Byte

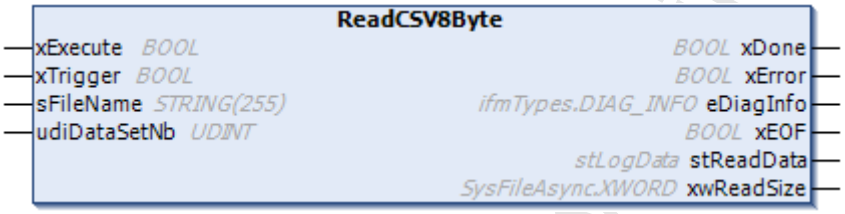

21526

Function block type: Function block (FB)

Behaviour model: EXECUTE with Trigger

Library: ifmFileUtil.library

Symbol in CODESYS:

Description

21527

The FB reads data sets of a CSV file and provides them. The FB assigns the value 0 to unused cells. The FB stores the time stamp of each data set.The CSV must have been created by means of the FB **WriteCSV8Byte** (→ p. 178).

Each data set has to have a size of 54 bytes.

Input parameter

21528

Parameter	Data type	Description	Possible values	
xExecute	BOOL	Control execution of the FB	FALSE ⇨ TRUE	FB is executed once
			Other	No impact on FB processing
xTrigger	BOOL	Trigger action	FALSE ⇨ TRUE	FB reads the selected data set
			Other	No action
sFileName	STRING	Directory path and name of the file	E.g. '/home/project/data.txt'	
udiDataSetNb	UDINT	Number of the data set to be read from the file	0 ... 65535	

© ifm electronic gmbh

Output parameter

21529

Parameter	Data type	Description	Possible values	
xDone	BOOL	Indication of whether execution of the FB has been successfully completed	FALSE	FB is executed
			TRUE	▪ FB successfully executed ▪ FB can be called again
xError	BOOL	Indication if an error occurred during the FB execution	FALSE	No error occurred or the FB is still being executed
			TRUE	▪ Error occurred ▪ Action could not be executed ▪ Note diagnostic information
eDiagInfo	DIAG_INFO	Diagnostic information	→ List below (diagnostic codes:)	
xEOF	BOOL	Indication of the file end	FALSE	File end not yet reached
			TRUE	File end reached
stReadData	stLogData	Data structure with all read data → **stLogData (STRUCT)** (→ p. 200)		
xwReadSize	XWORD	Size of the data set read last	54	Reading process successful
			Other	Reading process faulty

Diagnostic codes:

- STAT_INACTIVE — State: FB/Function is inactive.
- STAT_BUSY — State: FB/Function is currently executed.
- STAT_READY — State: File ready for triggered write / read accesses
- STAT_DONE — State: FB/Function has been successfully executed and completed. There are valid results on the outputs.
- ERR_INVALID_VALUE — Error: at least 1 invalid input parameter or invalid combination of input parameters; Function call has been stopped.
- ERR_FILE_SYSTEM — Error: File operation failed.
- ERR_NO_OBJECT — Error: File not available.

© ifm electronic gmbh

WriteCSV8Byte

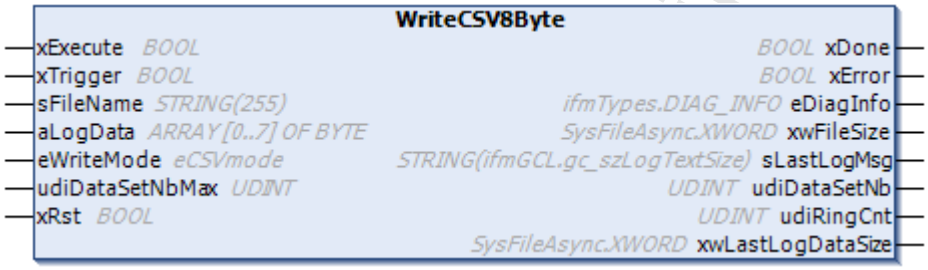

21550

Function block type: Function block (FB)

Behaviour model: EXECUTE with Trigger

Library: ifmFileUtil.library

Symbol in CODESYS:

Description

21551

The FB reads the data of an array of 8 bytes and writes them into a CSV file as a data set. The FB stores a time stamp in addition to each data set (date, time). After the data set has been written the FB automatically increments the pointer to the next array in the data structure.

Principle:

No. of the data set	Contents of the data set
1	Time stamp*, byte 0, byte 1, ..., Byte 7
2	Time stamp, byte 0, byte 1, ..., Byte 7
...	...
udiDataSetNbMax	Time stamp, byte 0, byte 1, ..., Byte 7

* ...Format of the time stamp DD.MM.YYYY HH:MM:SS

Example for a data set:

```
04.08.2016 19:59:55,0,15,245,15,251,15,0,8
```

The user can choose between the following write modes:

- **Linear**:
  The data sets are written linearly. Theoretically, the number of data sets is unlimited; it is only limited by the maximum file size predefined by the operating system. Existing data sets are not overwritten.

- **Ring**:
  The data is written into a ring buffer. The number of data sets is limited. After the last data set has been written the FB starts again at the first data set. Existing data sets are overwritten.

In the linear mode the bytes 0 to 53 are reserved for the CSV header. The CSV header can be added subsequently by means of the FB **WriteCSV8ByteHeader** (→ p. 181).

In the ring mode the CSV header must be written into the file before the writing of the data sets.

© ifm electronic gmbh

Input parameter

21552

Parameter	Data type	Description	Possible values	
xExecute	BOOL	Control execution of the FB	FALSE ⇨ TRUE	FB opens file
			TRUE ⇨ FALSE	▪ FB closes file ▪ All outputs are reset
xTrigger	BOOL	Trigger action	FALSE ⇨ TRUE	FB reads the selected data set
			Other	No action
sFileName	STRING	Directory path and name of the file	E.g. '/home/project/data.txt'	
aLogData	ARRAY [0...7] OF BYTE	Array with the data to be written into the CSV file		
eWriteMode	eCSVmode	Write mode → **eCSVmode (ENUM)** (→ p. 201)	LINEAR	Linear mode*
			RING	Ring mode
udiDataSetNbMax	UDINT	Maximum number of data sets in the ring mode	0 65535	
xRst	BOOL	Delete CSV file and pointer to the data set	FALSE ⇨ TRUE	Delete pointer and CSV file
			Other	No action

* ... preset value

The following entries for "sFileName" are invalid and cause an error message:

- No value entered
- Value is a file (e. g. /home/cds-apps/)
- Value contains subsequent "/" (e. g. /home/cds-apps///LogFile.csv)

© ifm electronic gmbh www.ifm.com

Output parameter

21553

Parameter	Data type	Description	Possible values	
xDone	BOOL	Indication of whether execution of the FB has been successfully completed	FALSE	FB is executed
			TRUE	▪ FB successfully executed ▪ FB can be called again
xError	BOOL	Indication if an error occurred during the FB execution	FALSE	No error occurred or the FB is still being executed
			TRUE	▪ Error occurred ▪ Action could not be executed ▪ Note diagnostic information
eDiagInfo	DIAG_INFO	Diagnostic information	→ List below (diagnostic codes:)	
xwFileSize	XWORD	Current file size of the file (in bytes)	0 ... 4294967295	
LastLogMsg	STRING	Data set written last as STRING	E.g. 06.12.2016 20:35:45,10,101,255,103,104,105,106,$n	
udiDataSetNb	UDINT	Number of the data set written into the file last	0 ... 65535	
udiRingCnt	UDINT	Counter for completed cycles of the ring buffer storage	0 ... 65535	

Diagnostic codes:

- STAT_INACTIVE — State: FB/Function is inactive.
- STAT_BUSY — State: FB/Function is currently executed.
- STAT_DONE — State: FB/Function has been successfully executed and completed. There are valid results on the outputs.
- STAT_READY — State: File ready for triggered write / read accesses
- ERR_INVALID_VALUE — Error: at least 1 invalid input parameter or invalid combination of input parameters; Function call has been stopped.
- ERR_FILE_SYSTEM — Error: File operation failed.
- ERR_INTERNAL — Error: Internal system error
  ► Contact the ifm Service Center!
- ERR_NO_OBJECT — Error: File not available.

WriteCSV8ByteHeader

21562

Function block type: Function block (FB)

Behaviour model: EXECUTE with Trigger

Library: ifmFileUtil.library

Symbol in CODESYS:

Description

21563

The FB writes the header into a CSV file. The header is always written in the bytes 0 to 53 of the file.

Input parameter

21564

Parameter	Data type	Description	Possible values	
xExecute	BOOL	Control execution of the FB	FALSE ⇨ TRUE	FB is executed once
			Other	No impact on FB processing
sFileName	STRING	Directory path and name of the file	E.g. '/home/project/data.txt'	
stHeader	stCSVHeader	Structure with header data → **stCSVHeader (STRUCT)** (→ p. 200)	Timestamp,R1C2,R1C3,...,R1C9*	

* ... preset value

The following entries for "sFileName" are invalid and cause an error message:

- No value entered
- Value is a file (e. g. /home/cds-apps/)
- Value contains subsequent "/" (e. g. /home/cds-apps///LogFile.csv)

© ifm electronic gmbh

Output parameter

21565

Parameter	Data type	Description	Possible values	
xDone	BOOL	Indication of whether execution of the FB has been successfully completed	FALSE	FB is executed
			TRUE	▪ FB successfully executed ▪ FB can be called again
xError	BOOL	Indication if an error occurred during the FB execution	FALSE	No error occurred or the FB is still being executed
			TRUE	▪ Error occurred ▪ Action could not be executed ▪ Note diagnostic information
eDiagInfo	DIAG_INFO	Diagnostic information	→ List below (diagnostic codes:)	
LastLogMsg	STRING	Written header as STRING		
udiDataSetPosi	UDINT	Number of the data set written last	0 65535	

Diagnostic codes:

- STAT_INACTIVE — State: FB/Function is inactive.
- STAT_BUSY — State: FB/Function is currently executed.
- STAT_DONE — State: FB/Function has been successfully executed and completed. There are valid results on the outputs.
- ERR_INVALID_VALUE — Error: at least 1 invalid input parameter or invalid combination of input parameters; Function call has been stopped.
- ERR_FILE_SYSTEM — Error: File operation failed.

ReadParmSingleAsync

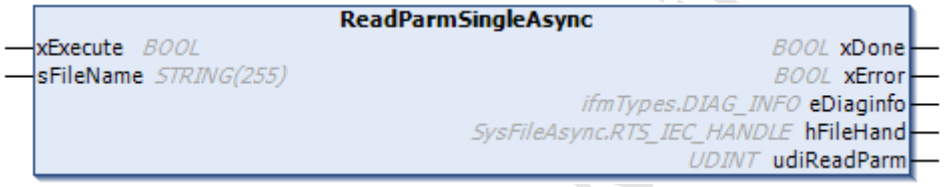

19010

Function block type: Function block (FB)

Behaviour model: EXECUTE

Library: ifmFileUtil.library

Symbol in CODESYS:

Description

12763

The FB reads a single data set of the UINT type of a text file and provides it.

The file must only contain this single data set. The value in the file must be stored as a 10-digit value and right-aligned.

Example:

Value	Saved in the file as
1	000000001
123	000000123
12345567890	1234567890

Input parameter

12766

Parameter	Data type	Description	Possible values	
xExecute	BOOL	Control execution of the FB	FALSE ⇨ TRUE	FB is executed once
			Other	No impact on FB processing
sFileName	STRING	Directory path and name of the file	E.g. '/home/project/data.txt'	

© ifm electronic gmbh

Output parameter

12677

Parameter	Data type	Description	Possible values	
xDone	BOOL	Indication of whether execution of the FB has been successfully completed	FALSE	FB is executed
			TRUE	▪ FB successfully executed ▪ FB can be called again
xError	BOOL	Indication if an error occurred during the FB execution	FALSE	No error occurred or the FB is still being executed
			TRUE	▪ Error occurred ▪ Action could not be executed ▪ Note diagnostic information
eDiagInfo	DIAG_INFO	Diagnostic information	→ List below (diagnostic codes:)	
hFileHand	RTS_IEC_HANDLE	File description of the runtime system	< 1	Error
			Other	No error
udiReadParm	UDINT	Parameter read from the text file	0 ... 4294967295	

▪

Diagnostic codes:

- STAT_INACTIVE — State: FB/Function is inactive.
- STAT_BUSY — State: FB/Function is currently executed.
- STAT_DONE — State: FB/Function has been successfully executed and completed. There are valid results on the outputs.
- ERR_INVALID_VALUE — Error: at least 1 invalid input parameter or invalid combination of input parameters; Function call has been stopped.

Buffer_To_String

SYS_OBJECTID>

Function block type: Function block (FB)

Behaviour model: EXECUTE

Library: ifmFileUtil.library

Symbol in CODESYS:

Description

21496

The FB reads a BYTE array, concatenates the values and provides the result in a STRING array.

- Size of the BYTE array: 500 bytes
- Size of the STRING array: 25 strings

If the FB finds the control character for line end/line break in the source data it writes the subsequent data into a new array line.

If the FB finds a 0 value or the control character for file end in the source data it terminates the conversion.

BUFFER_TO_STRING is a help function for other function blocks.

Input parameter

21497

Parameter	Data type	Description	Possible values	
xExecute	BOOL	Control execution of the FB	FALSE ⇨ TRUE	FB is executed once
			Other	No impact on FB processing
abyInData	ARRAY [0...499] OF BYTE	Buffer storage containing the data to be read	Per byte: 0x00 ... 0xFF	

© ifm electronic gmbh

Output parameter

21498

Parameter	Data type	Description	Possible values	
xDone	BOOL	Indication of whether execution of the FB has been successfully completed	FALSE	FB is executed
			TRUE	▪ FB successfully executed ▪ FB can be called again
xError	BOOL	Indication if an error occurred during the FB execution	FALSE	No error occurred or the FB is still being executed
			TRUE	▪ Error occurred ▪ Action could not be executed ▪ Note diagnostic information
eDiagInfo	DIAG_INFO	Diagnostic information	→ List below (diagnostic codes:)	
aTextLine	ARRAY [0..24] OF STRING	Array with converted text lines		
byNoOfTextLine	BYTE	Number of lines found in the array		

Diagnostic codes:

- STAT_INACTIVE — State: FB/Function is inactive.
- STAT_BUSY — State: FB/Function is currently executed.
- STAT_DONE — State: FB/Function has been successfully executed and completed. There are valid results on the outputs.

© ifm electronic gmbh

GetFileSizeAsync

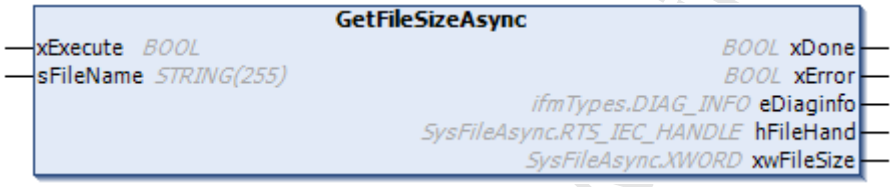

21700

Function block type: Function block (FB)

Behaviour model: EXECUTE

Library: ifmFileUtil.library

Symbol in CODESYS:

Description

3952

The FB determines the size of a file.

Input parameter

11620

Parameter	Data type	Description	Possible values	
xExecute	BOOL	Control execution of the FB	FALSE ⇨ TRUE	FB is executed once
			Other	No impact on FB processing
sFileName	STRING	Directory path and name of the file	E.g. '/home/project/data.txt'	

The following entries for "sFileName" are invalid and cause an error message:

- No value entered
- Value is a file (e. g. /home/cds-apps/)
- Value contains subsequent "/" (e. g. /home/cds-apps///LogFile.csv)

© ifm electronic gmbh

Output parameter

2075

Parameter	Data type	Description	Possible values	
xDone	BOOL	Indication of whether execution of the FB has been successfully completed	FALSE	FB is executed
			TRUE	▪ FB successfully executed ▪ FB can be called again
xError	BOOL	Indication if an error occurred during the FB execution	FALSE	No error occurred or the FB is still being executed
			TRUE	▪ Error occurred ▪ Action could not be executed ▪ Note diagnostic information
eDiagInfo	DIAG_INFO	Diagnostic information	→ List below (diagnostic codes:)	
hFileHand	RTS_IEC_HANDLE	File description of the runtime system	< 1	Error
			Other	No error
xwFileSize	XWORD	Current file size of the file (in bytes)	0 ... 4294967295	

Diagnostic codes:

- STAT_INACTIVE — State: FB/Function is inactive.
- STAT_BUSY — State: FB/Function is currently executed.
- STAT_DONE — State: FB/Function has been successfully executed and completed. There are valid results on the outputs.
- ERR_INVALID_VALUE — Error: at least 1 invalid input parameter or invalid combination of input parameters; Function call has been stopped.
- ERR_FILE_SYSTEM — Error: File operation failed.
- ERR_NO_OBJECT — Error: File not available.

© ifm electronic gmbh

GetMemoryInfoAsync

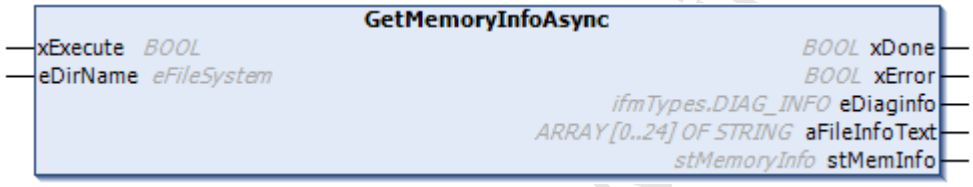

21520

Function block type: Function block (FB)

Behaviour model: EXECUTE

Library: ifmFileUtil.library

Symbol in CODESYS:

Description

21521

The FB provides detailed information about the memory usage and the available memory of a directory (e. g. /data). The FB stores the information in a text file that has the same name as the value at "eDirName". The text files are stored in the following directories:

eDirName	Memory location
NAND_FLASH_1GB	/data/
Other	/home/cds-apps/PlcLogic/

Example:
eDirName: HOME
Memory location: /home/cds-apps/PlcLogic/home.txt

Input parameter

21522

Parameter	Data type	Description	Possible values	
xExecute	BOOL	Control execution of the FB	FALSE ⇨ TRUE	FB is executed once
			Other	No impact on FB processing
eDirName	eFileSystem	Directory whose storage information is to be read	→ **eFileSystem (ENUM)** (→ p. 201)	

© ifm electronic gmbh

Output parameter

21523

Parameter	Data type	Description	Possible values	
xDone	BOOL	Indication of whether execution of the FB has been successfully completed	FALSE	FB is executed
			TRUE	▪ FB successfully executed ▪ FB can be called again
xError	BOOL	Indication if an error occurred during the FB execution	FALSE	No error occurred or the FB is still being executed
			TRUE	▪ Error occurred ▪ Action could not be executed ▪ Note diagnostic information
eDiagInfo	DIAG_INFO	Diagnostic information	→ List below (diagnostic codes:)	
aFileInfoText	ARRAY [0..24] OF STRING	Array with storage information of the directory path		
stMemInfo	stMemoryInfo	Memory information read from the device	→ **stMemoryInfo (STRUCT)** (→ p. 200)	

Diagnostic codes:

- STAT_INACTIVE — State: FB/Function is inactive.
- STAT_BUSY — State: FB/Function is currently executed.
- STAT_DONE — State: FB/Function has been successfully executed and completed. There are valid results on the outputs.
- ERR_INVALID_VALUE — Error: at least 1 invalid input parameter or invalid combination of input parameters; Function call has been stopped.
- ERR_FILE_SYSTEM — Error: File operation failed.
- ERR_NO_OBJECT — Error: File not available.
- ERR_INTERNAL — Error: Internal system error

ByteArray_To_String

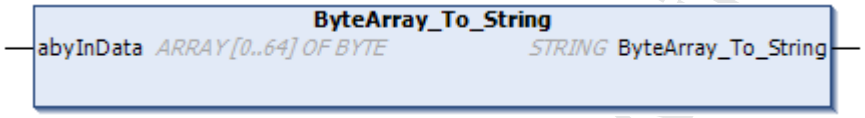

21578

Function block type: Function (FUN)

Behaviour model: --

Library: ifmFileUtil.library

Symbol in CODESYS:

Description

21579

The function reads a byte array, concatenates the values and provides them as a STRING.

Input parameter

21580

Parameter	Data type	Description	Possible values
abyInData	ARRAY [0...63] OF BYTE	Array with input data	Per byte: 0x00 ... 0xFF

Output parameter

21581

Parameter	Data type	Description	Possible values
ByteArray_To_String	STRING	Return value of the function	

© ifm electronic gmbh

DW_To_4Byte

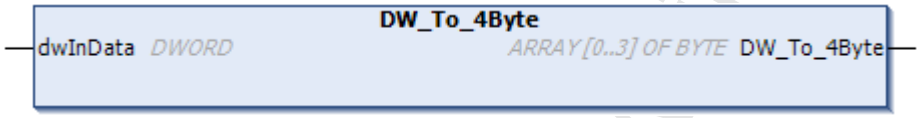

21584

Function block type: Function (FUN)

Behaviour model: --

Library: ifmFileUtil.library

Symbol in CODESYS:

Description

21585

The function converts a DWORD into an array of 4 bytes.
Example:
DWORD: 0xFFEEDDCC
ARRAY [0...3] OF BYTE: 0xFF | 0xEE | 0xDD | 0xCC

Input parameter

21586

Parameter	Data type	Description	Possible values
dwInData	DWORD	Data	E.g. 0xFFDDEECC

Output parameter

21587

Parameter	Data type	Description	Possible values
DW_To_4BytebyNoOfTextLine	ARRAY [0..3] OF BYTE	Return value of the function	E.g. Byte 0: CC Byte 1: DD Byte 2: EE Byte 3: FF

© ifm electronic gmbh www.ifm.com

Pack2Byte_To_Word

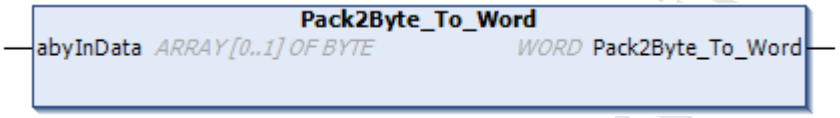

21591

Function block type: Function (FUN)

Behaviour model: --

Library: ifmFileUtil.library

Symbol in CODESYS:

Description

21592

The function converts an array of 2 bytes into a word.

Example:

aInData[0] = 0x00
aInData[1] = 0xAA

Pack2Byte_To_Word = 0xAA00

Input parameter

21593

Parameter	Data type	Description	Possible values
abyInData	ARRAY [0...1] OF BYTE	Array with input data	Per byte: 0x00 ... 0xFF

Output parameter

21595

Parameter	Data type	Description	Possible values
Pack2Byte_To_Word	WORD	Return value of the function	0x0000 ... 0xFFFF

© ifm electronic gmbh

Pack4Byte_To_DW

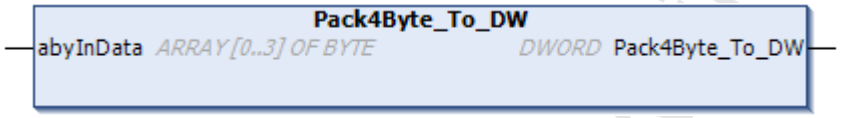

21614

Function block type: Function (FUN)

Behaviour model: --

Library: ifmFileUtil.library

Symbol in CODESYS:

Description

21615

The function converts an array of 4 bytes into a double word.

Example:

aInData[0] = 0x00
aInData[1] = 0x11
aInData[2] = 0xAA
aInData[3] = 0xFF

Pack4Byte = 0xFFAA1100

Input parameter

21616

Parameter	Data type	Description	Possible values
abyInData	ARRAY [0...3] OF BYTE	Array with input data	Per byte: 0x00 ... 0xFF

Output parameter

21617

Parameter	Data type	Description	Possible values
Pack4Byte_To_DW	DWORD	Return value of the function	0x00000000 ... 0xFFFFFFFF

© ifm electronic gmbh

RTC_To_String

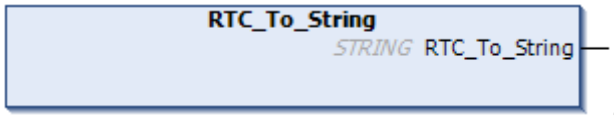

21621

Function block type: Function (FUN)

Behaviour model: --

Library: ifmFileUtil.library

Symbol in CODESYS:

Description

21622

The function reads the device-internal real-time clock (RTC) and provides the operating time in seconds since the last system start as a string.

Output parameter

21624

Parameter	Data type	Description	Possible values
RTC_To_String	STRING	Current time in the format `DD.MM.YYYY HH:MM:SS`	E.g. `02.08.2016 08:59:03`

© ifm electronic gmbh www.ifm.com

Word_To_2Byte

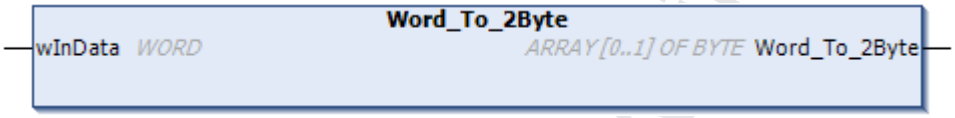

21634

Function block type: Function (FUN)

Behaviour model: --

Library: ifmFileUtil.library

Symbol in CODESYS:

Description

21635

The function converts a WORD into an array of 2 bytes.

Example:

wInData = 0xFFEE

Word_To_2Byte[0] = 0xEE
Word_To_2Byte[1] = 0xFF

Input parameter

21623

Parameter	Data type	Description	Possible values
wInData	WORD	Data	0x0000 ... 0xFFFF

Output parameter

21636

Parameter	Data type	Description	Possible values
Word_To_2Byte	ARRAY [0..1] OF BYTE	Return value of the function	Per byte: 0x00 ... 0xFF

© ifm electronic gmbh

_8Byte_To_CSV

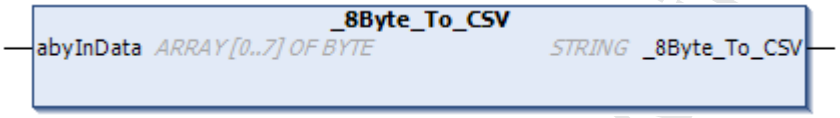

21639

Function block type: Function (FUN)

Behaviour model: --

Library: ifmFileUtil.library

Symbol in CODESYS:

Description

21640

The function converts the data of an array of 8 bytes into a CSV string and provides this string. One-digit and two-digit numbers are supplemented with leading zeros. The individual values are separated by a comma. The line end is indicated by a comma (,).

Example:

aInData[0] = 0x00
aInData[1] = 0x01
aInData[2] = 0x63
aInData[3] = 0x64
aInData[4] = 0xA0
aInData[5] = 0xEE
aInData[6] = 0xFF
aInData[7] = 0x11

8byte_To_CSV = 000,001,099,100,160,238,255,017,

Input parameter

21641

Parameter	Data type	Description	Possible values
abyInData	ARRAY [0..7] OF BYTE	Array with input data	Per byte: 0x00 ... 0xFF

Output parameter

21642

Parameter	Data type	Description	Possible values
_8Byte_To_CSV	STRING	CSV string; individual bytes are separated by a comma	E.g. 002,004,008,016,032,064,128,255

© ifm electronic gmbh www.ifm.com

stCSVHeader (STRUCT)

21484

Designation	Data type	Description	Possible values
sColumn1	STRING (18)	Heading of column 1	DateAndTime*
sColumn2	STRING (3)	Heading of column 2	R1C2*
sColumn3	STRING (3)	Heading of column 3	R1C3*
sColumn4	STRING (3)	Heading of column 4	R1C4*
sColumn5	STRING (3)	Heading of column 5	R1C5*
sColumn6	STRING (3)	Heading of column 6	R1C6*
sColumn7	STRING (3)	Heading of column 7	R1C7*
sColumn8	STRING (3)	Heading of column 8	R1C8*
sColumn9	STRING (3)	Heading of column 9	R1C9*

* ... * preset value (R = Row, C = Column, R1C2 = Row 1, Column 2)

stMemoryInfo (STRUCT)

21486

Designation	Data type	Description	Possible values
udiTotalKB	UDINT	Total memory (in Kbytes)	
udiUsedKB	UDINT	Memory used (in Kbytes)	
udiAvailKB	UDINT	Free memory (in Kbytes)	
usiUsedPerc	UDINT	Percentage of the memory used referred to the entire memory (in %)	

stLogData (STRUCT)

21485

Designation	Data type	Description	Possible values
sTimeStamp	STRING	Time stamp (DD.MM.YYYY HH:MM:SS)	
aData	ARRAY [0...7] OF BYTE	CSV data set	
sRawData	STRING	sTimeStamp and aData as STRING; Values are separated by a comma	

© ifm electronic gmbh www.ifm.com

eCSVmode (ENUM)

The library contains program blocks (POU) and enumeration types for the control of the inputs and outputs of the device.

© ifm electronic gmbh

SupplySwitch

21288

Function block type: Function block (FB)

Behaviour model: ENABLE

Library: ifmIOcommon.library

Symbol in CODESYS:

Description

21289

The FB stops all running applications and switches off the voltage supply latching (terminal 30) in order to shut down the device safely.

The voltage supply latching is only deactivated if the following conditions are met simultaneously:

- Voltage at terminal 15 (VBB15) < minimal operating voltage
- Voltage at terminal 30 (VBB30) <= Power down threshold
- Voltage at terminal 30 (VBB30) >= Protected Overvoltage threshold

Separation of the VBBs is done before the next PLC cycle starts. Depending on the charging status of the internal capacitors it may take some time until the device switches off.

Input parameter

21290

Parameter	Data type	Description	Possible values	
xEnable	BOOL	Control activity of the FB	FALSE	FB is deactivated
			TRUE	FB is activated
xSwitchOff	BOOL	Deactivate latching switch of the device	FALSE	No action
			TRUE	Request deactivation of the latching switch

© ifm electronic gmbh

Output parameter

SYS_OBJECTID>

Parameter	Data type	Description	Possible values	
xError	BOOL	Indication if an error occurred during the FB execution	FALSE	No error occurred or the FB is still being executed
			TRUE	▪ Error occurred ▪ Action could not be executed ▪ Note diagnostic information
eDiagInfo	DIAG_INFO	Diagnostic information	→ List below (diagnostic codes:)	

Diagnostic codes:

- STAT_INACTIVE — State: FB/Function is inactive.
- STAT_DONE — State: FB/Function has been successfully executed and completed. There are valid results on the outputs.
- ERR_INTERNAL — Error: Internal system error
  ► Contact the ifm Service Center!
- ERR_UNDEFINED — Error: Unknown error
  ► Contact the ifm Service Center!
- ERR_NOT_SUPPORTED — Error: Invalid function calls; Function is not supported.
- ERR_ACCESS — Error: FB/Funktion cannot access the required resource; Resource is blocked by another task.

© ifm electronic gmbh

INPUT_FILTER (ENUM)

14409

Name	Description	Possible values	
INPUT_FILTER	Valid filters for inputs of the FBs (in Hz)	FILTER_OFF	No filtering
		FILTER_120_HZ	120 Hz
		FILTER_47_HZ	47 Hz
		FILTER_22_HZ	22 Hz
		FILTER_10_HZ	10 Hz
		FILTER_5_0_HZ	5 Hz
		FILTER_2_5_HZ	2,5 Hz
		FILTER_1_2_HZ	1,2 Hz
		FILTER_0_7_HZ	0,7 Hz

INPUT_MODE (ENUM)

21349

Name	Description	Possible values	
INPUT_MODE	Operating mode of the inputs	OFF	Inactive; Outputs are not updated
		IN_DIGITAL_CSI_DIGITAL	digital current sinking voltage level measurement and evaluation.
		IN_DIGITAL_CSI	current sinking with analogue measurement and digital evaluation. No diagnosis.
		IN_DIGITAL_CSI_NAMUR	current sinking with analogue measurement and digital evaluation. Diagnosis capable by NAMUR.
		IN_DIGITAL_CSI_OSSD	current sinking for evaluation of OSSD compliant sensors with diagnosis.
		IN_DIGITAL_CSO	current sourcing with analogue measurement and digital evaluation. No diagnosis.
		IN_VOLTAGE_10	analogue current sinking voltage measurement 0-10 V.
		IN_VOLTAGE_32	current sinking voltage measurement 0-32 V.
		IN_VOLTAGE_RATIO	ratiometric current sinking voltage measurement.
		IN_VOLTAGE_RATIO_CSO	ratiometric current sourcing voltage measurement.
		IN_CURRENT_CSI	current sinking current measurement 0-20 mA.
		IN_FREQUENCY_CSI	current sinking frequency measurement.
		IN_FREQUENCY_CSO	current sourcing with frequency measurement.
		IN_RESISTOR	current sinking with resistance measurement.

© ifm electronic gmbh www.ifm.com

Name	Description	Possible values	
		IN_PERIOD_RATIO_CSI	current sinking for absolute and ratiometcric period measurement.
		IN_PERIOD_RATIO_CSO	current sourcing for absolute and ratiometric period measurement.
		IN_INC_ENCODER_CSI	current sinking for incremental encoder evaluation. (‘A’ channel)
		IN_INC_ENCODER_CSO	current sourcing for incremental encoder evaluation. (‘A’ channel)
		IN_PHASE_CSI	current sinking for phase measurement (‘A’ channel).
		IN_PHASE_CSO	current sourcing for phase measurement (‘A’ channel).
		IN_COUNT_CSI	current sinking for counting edges of fast signals.
		IN_COUNT_CSO	current sourcing for counting edges of fast signals.
		IN_SYSTEM_VOLTAGE_CSI	current sinking for system voltage measurement.
		IN_BOARD_TEMPERATURE_CSI	current sinking for system temperature measurement. E.g. board temperature.

BuzzerOn

11533

Function block type: Function block (FB)

Behaviour model: ENABLE

Library: ifmPDM360NGutil.library

Symbol in CODESYS:

Description

21190

The FB activates/deactivates the device-internal buzzer with the configured properties.
Adjustable properties:

- Tone pitch of the buzzer

Within a application only one instance of the FB may be active at a time.
► Call only one instance of the FB within a application!

Configuration of tone pitch and tone duration: → ***BuzzerClick*** (→ p. 223)

Input parameter

21192

Parameter	Data type	Description	Possible values	
xEnable	BOOL	Control activity of the FB	FALSE	FB is deactivated
			TRUE	FB is activated
uiFreq	UINT	Tone pitch of the buzzer (in Hz)	500 ... 5000	500 Hz ... 5000 Hz

© ifm electronic gmbh www.ifm.com

Output parameter

21193

Parameter	Data type	Description	Possible values	
xError	BOOL	Indication if an error occurred during the FB execution	FALSE	No error occurred or the FB is still being executed
			TRUE	▪ Error occurred ▪ Action could not be executed ▪ Note diagnostic information
eDiagInfo	DIAG_INFO	Diagnostic information	→ List below (diagnostic codes:)	

Diagnostic codes:

- STAT_INACTIVE — State: FB/Function is inactive.
- STAT_BUSY — State: FB/Function is currently executed.
- STAT_DONE — State: FB/Function has been successfully executed and completed. There are valid results on the outputs.
- ERR_NOT_SUPPORTED — Error: Invalid function calls; Function is not supported.
- ERR_INVALID_FREQUENCY — Error: Invalid frequency value; Function call has been stopped.
- ERR_INTERNAL — Error: Internal system error
  ► Contact the ifm Service Center!
- ERR_IINVALID_CHANNEL — Error: No audio signalling device (buzzer) available in the device
- ERR_UNDEFINED — Error: Unknown error
  ► Contact the ifm Service Center!

DisableTouchScreen

21333

Function block type: Function block (FB)

Behaviour model: EXECUTE

Library: ifmPDM360NGutil.library

Symbol in CODESYS:

Description

21330

The FB activates/deactivates the touch screen functionality of the display.

The POU is only available for the following devices: CR1082, CR1201.

The touch screen functionality is activated by default upon start-up of the device.

Input parameter

21342

Parameter	Data type	Description	Possible values	
xExecute	BOOL	Control execution of the FB	FALSE ⇨ TRUE	FB is executed once
			Other	No impact on FB processing
xDisableTouch	BOOL	Activate/deactivate the touch screen functionality of the display	FALSE	Touch screen functionality activated
			TRUE	Touch screen functionality deactivated

© ifm electronic gmbh www.ifm.com

Output parameter

21343

Parameter	Data type	Description	Possible values	
xDone	BOOL	Indication of whether execution of the FB has been successfully completed	FALSE	FB is executed
			TRUE	▪ FB successfully executed ▪ FB can be called again
xError	BOOL	Indication if an error occurred during the FB execution	FALSE	No error occurred or the FB is still being executed
			TRUE	▪ Error occurred ▪ Action could not be executed ▪ Note diagnostic information
eDiagInfo	DIAG_INFO	Diagnostic information	→ List below (diagnostic codes:)

InitNANDflashAsync

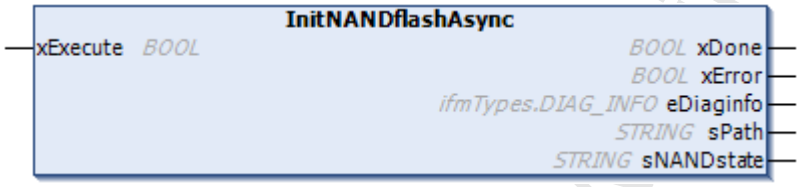

21420

Function block type: Function block (FB)

Behaviour model: EXECUTE

Library: ifmPDM360NGutil.library

Symbol in CODESYS:

Description

21421

The FB initialises the device-internal NAND flash memory and adds it to the file system of the device under the path `/data`.

Only for devices with 1 GB NAND flash memory (→ installation instructions).

If the data memory `/data` is not to be used in the CODESYS project, no initialisation of the NAND memory is necessary.

The initialisation process of the NAND memory takes about 2 seconds. During that time the memory cannot be accessed.

► Do not access the NAND memory before the value TRUE is provided at FB output DONE.

The FB generates the following text files on the device during initialisation. The user can use the contents of the files for diagnostics:

- `/data/NANDmountLogs.txt`
  Contains status messages of the initialisation process
- `/data/NANDmountStat.txt`
  Contains the final initialisation status of the memory

Input parameter

21422

Parameter	Data type	Description	Possible values	
xExecute	BOOL	Control execution of the FB	FALSE ⇨ TRUE	FB is executed once
			Other	No impact on FB processing

© ifm electronic gmbh www.ifm.com

Output parameter

21423

Parameter	Data type	Description	Possible values	
xDone	BOOL	Indication of whether execution of the FB has been successfully completed	FALSE	FB is executed
			TRUE	▪ FB successfully executed ▪ FB can be called again
xError	BOOL	Indication if an error occurred during the FB execution	FALSE	No error occurred or the FB is still being executed
			TRUE	▪ Error occurred ▪ Action could not be executed ▪ Note diagnostic information
eDiagInfo	DIAG_INFO	Diagnostic information	→ List below (diagnostic codes:)	
sPath	STRING	Absolute directory path of the NAND flash memory after initialisation	\data	Directory path
			No NAND Flash found!	Error occurred
sNANDstate	STRING	Status of the NAND flash memory	ubi1.datafs on /data type ubifs (rw,snyc,realtime)	NAND successfully initialised
			No NAND Flash found!	Error occurred

Diagnostic codes:

- STAT_INACTIVE — State: FB/Function is inactive.
- STAT_BUSY — State: FB/Function is currently executed.
- STAT_DONE — State: FB/Function has been successfully executed and completed. There are valid results on the outputs.
- ERR_FILE_SYSTEM — Error: NAND memory cannot be initialised.
  ► Check whether the device has a NAND memory.
  OR:
  Error: The initialisation status could not be read from the file NANDmountStat.txt
  ► Check whether the following message is contained in the file:
  "ubi1:datafs on /data type ubifs (rw,sync,realtime)$N"
  OR:
  Error: File NANDmountStat.txt cannot be read.
  ► Check whether the file can be accessed.
- ERR_NO_OBJECT — Error: The initialisation status could not be read from the file NANDmountStat.txt
  ► Check whether the file exists.

LinuxSysCallAsync

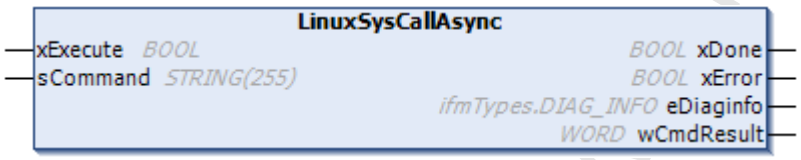

20935

Function block type: Function block (FB)

Behaviour model: EXECUTE

Library: ifmPDM360NGutil.library

Symbol in CODESYS:

Description

21464

The FB transmits a Linux command with parameters (max. 255 characters) to the operating system of the device and provides the return value of the command. The transmitted command is executed asynchronously in the background.

Input parameter

21465

Parameter	Data type	Description	Possible values	
xExecute	BOOL	Control execution of the FB	FALSE ⇨ TRUE	FB is executed once
			Other	No impact on FB processing
sCommand	STRING	Linux-Befehl inkl. Parameter (max. 255 characters)		

© ifm electronic gmbh

Output parameter

21466

Parameter	Data type	Description	Possible values	
xDone	BOOL	Indication of whether execution of the FB has been successfully completed	FALSE	FB is executed
			TRUE	▪ FB successfully executed ▪ FB can be called again
xError	BOOL	Indication if an error occurred during the FB execution	FALSE	No error occurred or the FB is still being executed
			TRUE	▪ Error occurred ▪ Action could not be executed ▪ Note diagnostic information
eDiagInfo	DIAG_INFO	Diagnostic information	→ List below (diagnostic codes:)	
wCmdResult	WORD	Return value of the Linux command	Depending on the command	

Diagnostic code:

- STAT_INACTIVE — State: FB/Function is inactive.
- STAT_BUSY — State: FB/Function is currently executed.
- STAT_DONE — State: FB/Function has been successfully executed and completed. There are valid results on the outputs.
- ERR_NOT_SUPPORTED — Error: Invalid function calls; Function is not supported.
- ERR_INVALID_VALUE — Error: at least 1 invalid input parameter or invalid combination of input parameters; Function call has been stopped.
- ERR_INTERNAL — Error: Internal system error
  ► Contact the ifm Service Center!
- ERR_UNDEFINED — Error: Unknown error
  ► Contact the ifm Service Center!

LoadSplashScreen

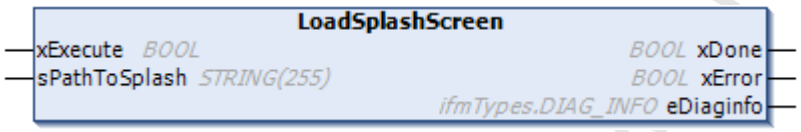

20934

Function block type: Function block (FB)

Behaviour model: EXECUTE

Library: ifmPDM360NGutil.library

Symbol in CODESYS:

Description

14533

The FB loads an image file in the flash memory of the device. The image file will be used as splash screen after the next reboot of the device.

Within a application only one instance of the FB may be active at a time.

► Call only one instance of the FB within a application!

Each call of the FB executes a write operation on the flash memory of the device.

► Do not call the function block cyclically in the program code!

► Observe the characteristics of the splash screen → **image properties** (→ p. 107)

Input parameter

21110

Parameter	Data type	Description	Possible values	
xExecute	BOOL	Control execution of the FB	FALSE ⇨ TRUE	FB is executed once
			Other	No impact on FB processing
sPathToSplash	STRING	Absolute directory path to the image file	E.g. \data\screenpic.bmp	

© ifm electronic gmbh www.ifm.com

Output parameter

SetBootupBacklight

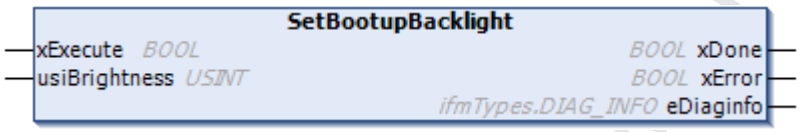

20933

Function block type: Function block (FB)

Behaviour model: EXECUTE

Library: ifmPDM360NGutil.library

Symbol in CODESYS:

Description

21428

The FB changes the brightness of the display for the duration of the start-up of the device. The new value is applied after the next reboot of the device.

Each call of the FB executes a write operation on the flash memory of the device.
► Do not call the function block cyclically in the program code!

Input parameter

21429

Parameter	Data type	Description	Possible values	
xExecute	BOOL	Control execution of the FB	FALSE ⇨ TRUE	FB is executed once
			Other	No impact on FB processing
usiBrightness	UINT	Brightness of the display (in %)	0 ... 10 ... 100	0 % ... 10 %* ... 100 %

* ... preset value

© ifm electronic gmbh www.ifm.com

Output parameter

21430

Parameter	Data type	Description	Possible values	
xDone	BOOL	Indication of whether execution of the FB has been successfully completed	FALSE	FB is executed
			TRUE	▪ FB successfully executed ▪ FB can be called again
xError	BOOL	Indication if an error occurred during the FB execution	FALSE	No error occurred or the FB is still being executed
			TRUE	▪ Error occurred ▪ Action could not be executed ▪ Note diagnostic information
eDiagInfo	DIAG_INFO	Diagnostic information	→ List below (diagnostic codes:)	

Diagnostic codes:

- STAT_INACTIVE — State: FB/Function is inactive.
- STAT_BUSY — State: FB/Function is currently executed.
- STAT_DONE — State: FB/Function has been successfully executed and completed. There are valid results on the outputs.
- ERR_INVALID_MODULE — Error: Internal parameter setting fault
  ► Contact the ifm Service Center!
- ERR_INVALID_CHANNEL — Error: Internal parameter setting fault
  ► Contact the ifm Service Center!
- ERR_INTERNAL — Error: Internal system error
  ► Contact the ifm Service Center!
- ERR_INVALID_VALUE — Error: at least 1 invalid input parameter or invalid combination of input parameters; Function call has been stopped.
- ERR_INVALID_FREQUENCY — Error: Internal parameter setting fault
  ► Contact the ifm Service Center!
- ERR_ACCESS — Error: FB/Funktion cannot access the required resource; Resource is blocked by another task.
- ERR_NOT_SUPPORTED — Error: Invalid function calls; Function is not supported.
- ERR_UNDEFINED — Error: Unknown error
  ► Contact the ifm Service Center!

SetKeyClick

20931

Function block type: Function block (FB)

Behaviour model: EXECUTE

Library: ifmPDM360NGutil.library

Symbol in CODESYS:

Description

21471

The FB activates/deactivates the click sound function of the operating system. The click sound function confirms the actuation of a function key of the device by means of a sound.

The FB configures the properties of the click sound.

Adjustable properties:

- Tone pitch
- Duration of the sound

Input parameter

21472

Parameter	Data type	Description	Possible values	
xExecute	BOOL	Control execution of the FB	FALSE ⇨ TRUE	FB is executed once
			Other	No impact on FB processing
uiFreq	UINT	Frequency of the buzzer sound (in Hz)	500 ... 5000	500 Hz* ... 5000 Hz
tDuration	TIME	Duration of the buzzer sound (in ms)	1 ... 10	1 millisecond* ... 10 milliseconds
xOperMode	BOOL	Control key click function	FALSE	Deactivate function
			TRUE	Activate function

* ... preset value

© ifm electronic gmbh

Output parameter

21473

Parameter	Data type	Description	Possible values	
xDone	BOOL	Indication of whether execution of the FB has been successfully completed	FALSE	FB is executed
			TRUE	▪ FB successfully executed ▪ FB can be called again
xError	BOOL	Indication if an error occurred during the FB execution	FALSE	No error occurred or the FB is still being executed
			TRUE	▪ Error occurred ▪ Action could not be executed ▪ Note diagnostic information
eDiagInfo	DIAG_INFO	Diagnostic information	→ List below (diagnostic codes:)

The library contains POUs and data structures for the programming of the CAN Layer 2 level of the CAN interfaces of the device under CODESYS.

© ifm electronic gmbh

CAN_Enable

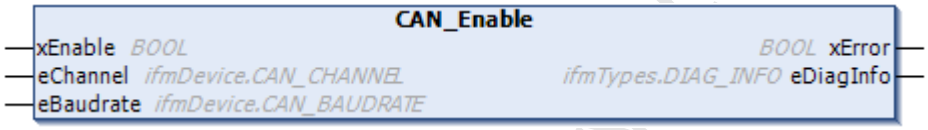

8709

Function block type: Function block (FB)

Behaviour model: ENABLE

Library: ifmRawCAN.library

Symbol in CODESYS:

Description

7073

The FB activates the CAN Layer 2 functions of a CAN interface with a certain transmission rate. Simultaneously the FB writes information about the current state of the CAN interface into the global variable CAN State.

Changes of the transmission rate or of the CAN interface are applied at once. All existing reception and send buffer storages are deleted.

The FB does not have any influence on a CANopen Manager / CANopen Device at the selected CAN interface. In this case the FB cannot change the transmission rate of the CAN interface.

Input parameter

11241

Parameter	Data type	Description	Possible values	
xEnable	BOOL	Control activity of the FB	FALSE	FB is deactivated
			TRUE	FB is activated
eChannel	CAN_ CHANNEL	Identifier of the CAN Interface	→ **CAN_CHANNEL (ENUM)** (→ p. 157)	
eBaudrate	CAN_ BAUD RATE	Baud rate of the CAN channel	→ **CAN_BAUDRATE (ENUM)** (→ p. 157)	

© ifm electronic gmbh www.ifm.com

Output parameter

7135

Parameter	Data type	Description	Possible values	
xError	BOOL	Indication if an error occurred during the FB execution	FALSE	No error occurred or the FB is still being executed
			TRUE	▪ Error occurred ▪ Action could not be executed ▪ Note diagnostic information
eDiagInfo	DIAG_INFO	Diagnostic information	→ List below (diagnostic codes:)	

Diagnostic codes:

- STAT_INACTIVE — State: FB/Function is inactive.
- STAT_DONE — State: FB/Function has been successfully executed and completed. There are valid results on the outputs.
- ERR_BUS_OFF — Error: CAN interface is in the "BUS OFF" state
- ERR_INTERNAL — Error: Internal system error
  ► Contact the ifm Service Center!
- ERR_INVALID_VALUE — Error: at least 1 invalid input parameter or invalid combination of input parameters; Function call has been stopped.
- ERR_BAUDRATE_ALREADY_SET — Error: Requested baud rate cannot be set because another baud rate has already been defined.
- ERR_UNDEFINED — Error: Unknown error
  ► Contact the ifm Service Center!

© ifm electronic gmbh www.ifm.com

CAN_Recover

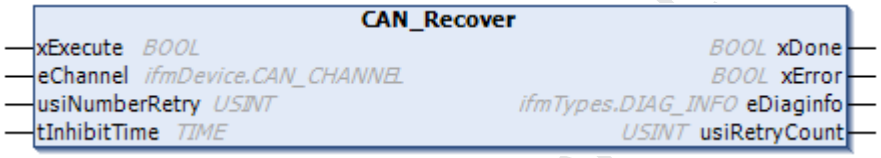

11765

Function block type: Function block (FB)

Behaviour model: EXECUTE

Library: ifmRawCAN.library

Symbol in CODESYS:

Description

11771

The FB controls the processing of a failure of the CAN channel.
The call of the FB triggers the following actions:

- If the CAN channel fails the CAN interface is reset and rebooted.
- All buffer storages are emptied.

If the CAN channel keeps failing after the maximum number of recovery attempts has been exceeded, the CAN bus remains in the error state.

► Call FB again to repeat the execution of the recovery function.

Input parameter

11768

Parameter	Data type	Description	Possible values	
xExecute	BOOL	Control execution of the FB	FALSE ⇨ TRUE	FB is executed once
			Other	No impact on FB processing
eChannel	CAN_ CHANNEL	Identifier of the CAN Interface	→ **CAN_CHANNEL (ENUM)** (→ p. 157)	
usiNumberRetry	USINT	Max. number of retries	E.g. 4	
tInhibitTime	TIME	Time until the CAN interface is started again after the detection of a CAN bus failure	E.g. `#2ms`	

© ifm electronic gmbh www.ifm.com

Output parameter

11769

Parameter	Data type	Description	Possible values	
xDone	BOOL	Indication of whether execution of the FB has been successfully completed	FALSE	FB is executed
			TRUE	▪ FB successfully executed ▪ FB can be called again
xError	BOOL	Indication if an error occurred during the FB execution	FALSE	No error occurred or the FB is still being executed
			TRUE	▪ Error occurred ▪ Action could not be executed ▪ Note diagnostic information
eDiagInfo	DIAG_INFO	Diagnostic information	→ List below (diagnostic codes:)	
usiRetryCount	USINT	Counter for retries carried out since the last activation of the FB		

Diagnostic codes:

- STAT_INACTIVE — State: FB/Function is inactive.
- STAT_DONE — State: FB/Function has been successfully executed and completed. There are valid results on the outputs.
- ERR_INACTIVE_INTERFACE — Error: Selected CAN channel is deactivated.
- ERR_INTERNAL — Error: Internal system error
  ► Contact the ifm Service Center!
- ERR_INVALID_VALUE — Error: at least 1 invalid input parameter or invalid combination of input parameters; Function call has been stopped.
- ERR_UNDEFINED — Error: Unknown error

CAN_RemoteRequest

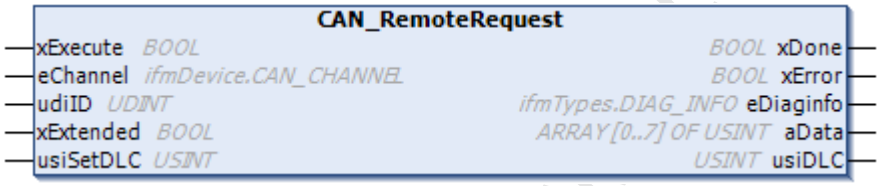

10884

Function block type: Function block (FB)

Behaviour model: EXECUTE

Library: ifmRawCAN.library

Symbol in CODESYS:

Description

10886

The FB sends the request for a CAN Remote message into a CAN network. The FB provides the data of the response message in an array. The FB supports standard and extended frames.

Input parameter

10888

Parameter	Data type	Description	Possible values	
xExecute	BOOL	Control execution of the FB	FALSE ⇨ TRUE	FB is executed once
			Other	No impact on FB processing
eChannel	CAN_ CHANNEL	Identifier of the CAN Interface	→ **CAN_CHANNEL (ENUM)** (→ p. 157)	
udiID	UDINT	Identifier of the CAN message	▪ for Standard Frame (11 bits identifier): 0 ... 2047 ▪ for Extended-Frame (29 bits identifier): 0 ... 536.870.911	
xExtended	BOOL	Requested frame type: - Standard Frame (11 bits identifier) - Extended-Frame (29 bits identifier)	FALSE	Standard Frame*
			TRUE	Extended Frame
usiDLC	UINT	Number of the data bytes in the CAN message (DLC = Data Length Count)	0 ... 7	0 bytes* ... 7 bytes

* ... preset value

© ifm electronic gmbh www.ifm.com

Output parameter

10890

Parameter	Data type	Description	Possible values	
xDone	BOOL	Indication of whether execution of the FB has been successfully completed	FALSE	FB is executed
			TRUE	▪ FB successfully executed ▪ FB can be called again
xError	BOOL	Indication if an error occurred during the FB execution	FALSE	No error occurred or the FB is still being executed
			TRUE	▪ Error occurred ▪ Action could not be executed ▪ Note diagnostic information

CAN_RemoteResponse

19902

Function block type: Function block (FB)

Behaviour model: ENABLE

Library: ifmRawCAN.library

Symbol in CODESYS:

Description

15962

The FB replies as reaction to the request of a CAN Remote message and sends the data required into a CAN network.

As long as the FB is activated it responds to each remote request message (automatic reply).

Several FB calls are possible during one PLC cycle.

Input parameter

9237

Parameter	Data type	Description	Possible values	
xEnable	BOOL	Control activity of the FB	FALSE	FB is deactivated
			TRUE	FB is activated
eChannel	CAN_ CHANNEL	Identifier of the CAN Interface	→ **CAN_CHANNEL (ENUM)** (→ p. 157)	
udiID	UDINT	Identifier of the CAN message	▪ for Standard Frame (11 bits identifier): 0 ... 2047 ▪ for Extended-Frame (29 bits identifier): 0 ... 536.870.911	
xExtended	BOOL	Requested frame type: - Standard Frame (11 bits identifier) - Extended-Frame (29 bits identifier)	FALSE	Standard Frame*
			TRUE	Extended Frame
usiDLC	UINT	Number of the data bytes in the CAN message (DLC = Data Length Count)	0 ... 7	0 bytes* ... 7 bytes

* ... preset value

© ifm electronic gmbh

Output parameter

11740

Parameter	Data type	Description	Possible values	
xError	BOOL	Indication if an error occurred during the FB execution	FALSE	No error occurred or the FB is still being executed
			TRUE	▪ Error occurred ▪ Action could not be executed ▪ Note diagnostic information

CAN_Rx

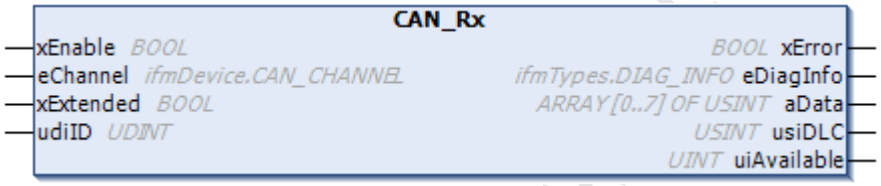

6939

Function block type: Function block (FB)

Behaviour model: ENABLE

Library: ifmRawCAN.library

Symbol in CODESYS:

Description

11777

The FB receives CAN messages with a defined identifier.

The FB receives all CAN messages with the indicated identifier between 2 FB calls and stores them in a FIFO buffer storage. The number of the received CAN messages is displayed. The CAN message received first is always provided on the output.

Input parameter

11784

Parameter	Data type	Description	Possible values	
xEnable	BOOL	Control activity of the FB	FALSE	FB is deactivated
			TRUE	FB is activated
eChannel	CAN_ CHANNEL	Identifier of the CAN Interface	→ **CAN_CHANNEL (ENUM)** (→ p. 157)	
xExtended	BOOL	Requested frame type: - Standard Frame (11 bits identifier) - Extended-Frame (29 bits identifier)	FALSE	Standard Frame*
			TRUE	Extended Frame
udiID	UDINT	Identifier of the CAN message	▪ for Standard Frame (11 bits identifier): 0 ... 2047 ▪ for Extended-Frame (29 bits identifier): 0 ... 536.870.911	

© ifm electronic gmbh

Output parameter

14640

Parameter	Data type	Description	Possible values	
xError	BOOL	Indication if an error occurred during the FB execution	FALSE	No error occurred or the FB is still being executed
			TRUE	▪ Error occurred ▪ Action could not be executed ▪ Note diagnostic information
eDiagInfo	DIAG_INFO	Diagnostic information	→ List below (diagnostic codes:)	
aData	ARRAY [0...7] OF USINT	Array for storage of the data received		
usiDLC	UINT	Number of the data bytes in the CAN message (DLC = Data Length Count)	0 ... 7	0 bytes* ... 7 bytes
uiAvailable	UINT	▪ Number of received CAN messages since the last FB call ▪ Current CAN message is taken into account	0	No CAN messages received between 2 FB calls
			n	n CAN messages received

Error codes:

- STAT_INACTIVE — State: FB/Function is inactive.
- STAT_DONE — State: FB/Function has been successfully executed and completed. There are valid results on the outputs.
- ERR_INACTIVE_INTERFACE — Error: Selected CAN channel is deactivated.
- ERR_BUFFER_OVERFLOW — Error: Transmission buffer full; CAN message cannot write to buffer storage and is not transmitted

CAN_RxMask

14643

Function block type: Function block (FB)

Behaviour model: ENABLE

Library: ifmRawCAN.library

Symbol in CODESYS:

Description

14641

The FB receives CAN messages of a non-coherent area. The area is defined by a bit pattern and a bit mask.

The following rules apply to the bit mask:

- 0: The equivalent bit of the CAN identifier can be 0 or 1
- 1: The equivalent bit of the CAN identifier must have the same value as the bit in the bit pattern

Example:

Pattern: `000 0010 0000`
Mask: `000 1111 1111`

Result: `xxx 0010 0000`

All CAN messages with an identifier whose 8 least significant bits have the value "0010 0000" are received.

E.g. 110 **0010 0000** 000 **0010 0000**, 001 **0010 0000**

General behaviour of the FB: → **CAN_Rx** (→ p. 234)

© ifm electronic gmbh

Input parameter

14638

Parameter	Data type	Description	Possible values	
xEnable	BOOL	Control activity of the FB	FALSE	FB is deactivated
			TRUE	FB is activated
eChannel	CAN_ CHANNEL	Identifier of the CAN Interface	→ **CAN_CHANNEL (ENUM)** (→ p. 157)	
xExtended	BOOL	Requested frame type: - Standard Frame (11 bits identifier) - Extended-Frame (29 bits identifier)	FALSE	Standard Frame*
			TRUE	Extended Frame
udiIDSet	UDINT	Preset bit pattern for the masking of the identifier of the CAN message	E.g. 000 0010 0000	
udiIDMask	UDINT	Bit pattern of the required area 1 ... bit relevant for selection 0 ... bit not relevant for selection	E.g. 000 1111 1111	

* ... preset value

© ifm electronic gmbh

Output parameter

11736

Parameter	Data type	Description	Possible values	
xError	BOOL	Indication if an error occurred during the FB execution	FALSE	No error occurred or the FB is still being executed
			TRUE	▪ Error occurred ▪ Action could not be executed ▪ Note diagnostic information
eDiagInfo	DIAG_INFO	Diagnostic information	→ List below (diagnostic codes:)	
aData	ARRAY [0...7] OF USINT	Array for storage of the data received		
usiDLC	UINT	Number of the data bytes in the CAN message (DLC = Data Length Count)	0 ... 7	0 bytes* ... 7 bytes
uiAvailable	UINT	▪ Number of received CAN messages since the last FB call ▪ Current CAN message is taken into account	0	No CAN messages received between 2 FB calls

CAN_RxRange

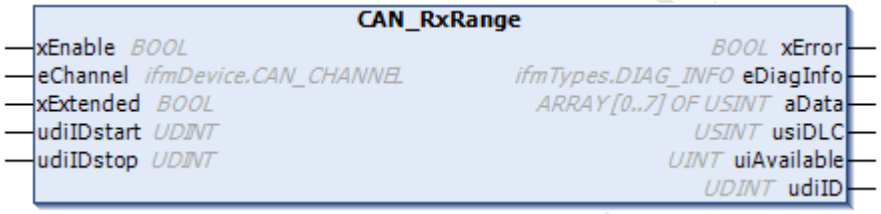

11731

Function block type: Function block (FB)

Behaviour model: ENABLE

Library: ifmRawCAN.library

Symbol in CODESYS:

Description

11732

The FB receives CAN messages of a coherent area. The area is defined by an upper and lower limit.

The following rules apply to the definition of this area:

- Lower and upper limit:
  Standard Frames: 0 ... 2047 (11-bit identifier)
  Extended Frames: 0 ... 536 870 911 (29-bit identifier)
- The value for the lower limit must be <= the value of the upper limit.

Example:

Lower limit: `000 0000 0010`

Upper limit: `000 0000 1000`

Result: All CAN messages with an identifier whose 4 least significant bits have a value between "0010" and "1000" are received.

General behaviour of the FB: → **CAN_Rx** (→ p. 234)

CAN_Tx

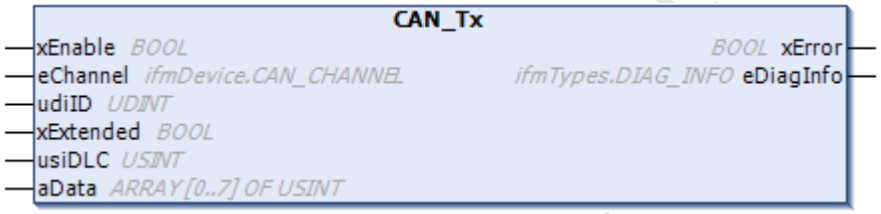

2269

Function block type: Function block (FB)

Behaviour model: ENABLE

Library: ifmRawCAN.library

Symbol in CODESYS:

Description

7401

By means of this FB CAN messages can be sent asynchronously. The FB writes the configured CAN message into the buffer storage of the selected CAN channel. When the CAN message is transmitted depends on the state of the CAN channel and the buffer storage. The FB and the PLC cycle do not have any influence on this.

The FB can be called several times during a PLC cycle.
The repeated call of the FB during a PLC cycle triggers a repeated transmission of the CAN message within the PLC cycle.

Input parameter

SYS_OBJECTID>

Parameter	Data type	Description	Possible values	
xEnable	BOOL	Control activity of the FB	FALSE	FB is deactivated
			TRUE	FB is activated
eChannel	CAN_ CHANNEL	Identifier of the CAN Interface	→ **CAN_CHANNEL (ENUM)** (→ p. 157)

GetInfo

20929

Function block type: Function block (FB)

Behaviour model: EXECUTE

Library: ifmSysInfo.library

Symbol in CODESYS:

Description

21219

The FB reads the following information of the device:

- Firmware version of the device (FW device)
- Firmware version of key row (FW keyboard 1)
- Firmware version of key row (FW keyboard 2)
- Firmware version of key row (FW keyboard 3)
- Firmware version of the watchdog (FW watchdog)
- Firmware version of the I/O driver (FW IO driver)
- Hardware revision (HW revision)
- Serial number of the device (SerialNumber)
- Manufacturing date (Manufacturer Date)

The FB writes the read values in the global variable → **aSysInfoList (GVL)** (→ p. 248).

Input parameter

21203

Parameter	Data type	Description	Possible values	
xExecute	BOOL	Control execution of the FB	FALSE ⇨ TRUE	FB is executed once
			Other	No impact on FB processing

© ifm electronic gmbh www.ifm.com

Output parameter

S_OBJECTID>

Parameter	Data type	Description	Possible values	
xDone	BOOL	Indication of whether execution of the FB has been successfully completed	FALSE	FB is executed
			TRUE	▪ FB successfully executed ▪ FB can be called again
xError	BOOL	Indication if an error occurred during the FB execution	FALSE	No error occurred or the FB is still being executed
			TRUE	▪ Error occurred ▪ Action could not be executed ▪ Note diagnostic information
eDiagInfo	DIAG_INFO	Diagnostic information	→ List below (diagnostic codes:)	

Diagnostic codes:

- STAT_INACTIVE — State: FB/Function is inactive.
- STAT_BUSY — State: FB/Function is currently executed.
- STAT_DONE — State: FB/Function has been successfully executed and completed. There are valid results on the outputs.
- ERR_NOT_SUPPORTED — Error: Invalid function calls; Function is not supported.
- ERR_INTERNAL — Error: Internal system error
  ► Contact the ifm Service Center!
- ERR_INVALID_VALUE — Error: At least one information type to be read is not supported by the device
- ERR_UNDEFINED — Error: Unknown error
  ► Contact the ifm Service Center!

10.2.10 Bibliothek ifmUSBstorageUtil.library

Contents

USBstorageHandler.....250

21402

The library contains function blocks (FB) for the control and management of USB memory devices.

© ifm electronic gmbh www.ifm.com

USBstorageHandler

21403

Function block type: Function block (FB)

Behaviour model: ENABLE with Busy Extension

Library: ifmUSBstorageUtil.library

Symbol in CODESYS:

Description

21404

The FB manages the USB device connected to the device. The FB carries out the following functions:

- Integrate USB device automatically into the file system of the device (mount)
- Provide path to the USB device in the file system of the device
- Remove USB device from the file system of the device upon command of the user (unmount)
- Signal insertion and removal of the USB device

Input parameter

21405

Parameter	Data type	Description	Possible values	
xEnable	BOOL	Control activity of the FB	FALSE	FB is deactivated
			TRUE	FB is activated
xRemoveDevice	BOOL	Remove USB device from the file system (unmount)	FALSE ⇨ TRUE	USB is removed
			Other	No action

© ifm electronic gmbh

Output parameter

21406

Parameter	Data type	Description	Possible values	
xError	BOOL	Indication if an error occurred during the FB execution	FALSE	No error occurred or the FB is still being executed
			TRUE	▪ Error occurred ▪ Action could not be executed ▪ Note diagnostic information
eDiagInfo	DIAG_INFO	Diagnostic information	→ List below (diagnostic codes:)	
xPrepared	BOOL	State of the FB outputs	FALSE	FB outputs still invalid; FB is still processed
			TRUE	FB outputs valid; FB has been processed
usiNumberUSBdevice	USINT	Number of the connected USB memory device	Usually `0` or `1`	
sAccessPath	STRING	Absolute directory path of the USB storage device	E.g. `/mnt/usb`	
xDevicePlugged	BOOL	Signals the insertion of a USB device within the current PLC cycle	FALSE	No USB device inserted
			TRUE	USB device inserted
xDeviceUnplugged	BOOL	Signals the removal of a USB device within the current PLC cycle	FALSE	USB device not removed
			TRUE	USB device has been removed

Diagnostic codes:

- STAT_INACTIVE — State: FB/Function is inactive.
- STAT_BUSY — State: FB/Function is currently executed.
- STAT_DONE — State: FB/Function has been successfully executed and completed. There are valid results on the outputs.
- STAT_PREPARING — State: FB/FUN is processed; final results are not yet available. Some output values are updated in each PLC cycle.
- ERR_UNDEFINED — Error: Unknown error
  ► Contact the ifm Service Center!
- ERR_NOT_IMPLEMENTED — Error: Function not implemented in the runtime system

© ifm electronic gmbh

11 Glossary of Terms

A

Address

This is the "name" of the bus participant. All participants need a unique address so that the signals can be exchanged without problem.

Application software

Software specific to the application, implemented by the machine manufacturer, generally containing logic sequences, limits and expressions that control the appropriate inputs, outputs, calculations and decisions.

Architecture

Specific configuration of hardware and/or software elements in a system.

B

Baud

Baud, abbrev.: Bd = unit for the data transmission speed. Do not confuse baud with "bits per second" (bps, bits/s). Baud indicates the number of changes of state (steps, cycles) per second over a transmission length. But it is not defined how many bits per step are transmitted. The name baud can be traced back to the French inventor J. M. Baudot whose code was used for telex machines.
1 MBd = 1024 x 1024 Bd = 1 048 576 Bd

Boot loader

On delivery **ecomat*mobile*** controllers only contain the boot loader.
The boot loader is a start program that allows to reload the runtime system and the application program on the device.
The boot loader contains basic routines...
• for communication between hardware modules,
• for reloading the operating system.
The boot loader is the first software module to be saved on the device.

Bus

Serial data transmission of several participants on the same cable.

C

CAN

CAN = **C**ontroller **A**rea **N**etwork
CAN is a priority-controlled fieldbus system for large data volumes. There are several higher-level protocols that are based on CAN, e.g. 'CANopen' or 'J1939'.

CAN stack

CAN stack = software component that deals with processing CAN messages.

CiA

CiA = CAN in Automation e.V.
User and manufacturer organisation in Germany / Erlangen. Definition and control body for CAN and CAN-based network protocols.
Homepage → www.can-cia.org

CiA DS 304

DS = **D**raft **S**tandard
CANopen device profile for safety communication

CiA DS 401

DS = **D**raft **S**tandard
CANopen device profile for binary and analogue I/O modules

CiA DS 402

DS = **D**raft **S**tandard
CANopen device profile for drives

CiA DS 403

DS = **D**raft **S**tandard
CANopen device profile for HMI

CiA DS 404

DS = **D**raft **S**tandard
CANopen device profile for measurement and control technology

CiA DS 405

DS = **D**raft **S**tandard
CANopen specification of the interface to programmable controllers (IEC 61131-3)

© ifm electronic gmbh www.ifm.com

CiA DS 406

DS = **D**raft **S**tandard
CANopen device profile for encoders

CiA DS 407

DS = **D**raft **S**tandard
CANopen application profile for local public transport

Clamp 15

In vehicles clamp 15 is the plus cable switched by the ignition lock.

COB ID

COB = **C**ommunication **Ob**ject
ID = **Id**entifier
ID of a CANopen communication object
Corresponds to the identifier of the CAN message with which the communication project is sent via the CAN bus.

CODESYS

CODESYS® is a registered trademark of 3S – Smart Software Solutions GmbH, Germany.
'CODESYS for Automation Alliance' associates companies of the automation industry whose hardware devices are all programmed with the widely used IEC 61131-3 development tool CODESYS®.
Homepage → www.codesys.com

CSV file

CSV = **C**omma **S**eparated **V**alues (also: **C**haracter **S**eparated **V**alues)
A CSV file is a text file for storing or exchanging simply structured data.
The file extension is `.csv`.

Example: Source table with numerical values:

value 1.0	value 1.1	value 1.2	value 1.3
value 2.0	value 2.1	value 2.2	value 2.3
value 3.0	value 3.1	value 3.2	value 3.3

This results in the following CSV file:

```
value 1.0;value 1.1;value 1.2;value 1.3
value 2.0;value 2.1;value 2.2;value 2.3
value 3.0;value 3.1;value 3.2;value 3.3
```

Cycle time

This is the time for a cycle. The PLC program performs one complete run.
Depending on event-controlled branchings in the program this can take longer or shorter.

D

Data type

Depending on the data type, values of different sizes can be stored.

Data type	min. value	max. value	size in the memory
BOOL	FALSE	TRUE	8 bits = 1 byte
BYTE	0	255	8 bits = 1 byte
WORD	0	65 535	16 bits = 2 bytes
DWORD	0	4 294 967 295	32 bits = 4 bytes
SINT	-128	127	8 bits = 1 byte
USINT	0	255	8 bits = 1 byte
INT	-32 768	32 767	16 bits = 2 bytes
UINT	0	65 535	16 bits = 2 bytes
DINT	-2 147 483 648	2 147 483 647	32 bits = 4 bytes
UDINT	0	4 294 967 295	32 bits = 4 bytes
REAL	$-3.402823466 \cdot 10^{38}$	$3.402823466 \cdot 10^{38}$	32 bits = 4 bytes
ULINT	0	18 446 744 073 709 551 615	64 Bit = 8 Bytes
STRING			number of char. + 1

DC

Direct **C**urrent

Diagnosis

During the diagnosis, the "state of health" of the device is checked. It is to be found out if and what →faults are given in the device.

Depending on the device, the inputs and outputs can also be monitored for their correct function.
- wire break,
- short circuit,
- value outside range.

For diagnosis, configuration and log data can be used, created during the "normal" operation of the device.
The correct start of the system components is monitored during the initialisation and start phase. Errors are recorded in the log file.
For further diagnosis, self-tests can also be carried out.

© ifm electronic gmbh www.ifm.com

Dither

Dither is a component of the →PWM signals to control hydraulic valves. It has shown for electromagnetic drives of hydraulic valves that it is much easier for controlling the valves if the control signal (PWM pulse) is superimposed by a certain frequency of the PWM frequency. This dither frequency must be an integer part of the PWM frequency.

DLC

Data **L**ength **C**ode = in CANopen the number of the data bytes in a message.
For →SDO: DLC = 8

DRAM

DRAM = **D**ynamic **R**andom **A**ccess **M**emory. Technology for an electronic memory module with random access (Random Access Memory, RAM). The memory element is a capacitor which is either charged or discharged. It becomes accessible via a switching transistor and is either read or overwritten with new contents. The memory contents are volatile: the stored information is lost in case of lacking operating voltage or too late restart.

DTC

DTC = **D**iagnostic **T**rouble **C**ode = error code
In the protocol J1939 faults and errors well be managed and reported via assigned numbers – the DTCs.

E

ECU

(1) **E**lectronic **C**ontrol **U**nit = control unit or microcontroller
(2) **E**ngine **C**ontrol **U**nit = control device of a engine

EDS-file

EDS = **E**lectronic **D**ata **S**heet, e.g. for:
- File for the object directory in the CANopen master,
- CANopen device descriptions.

Via EDS devices and programs can exchange their specifications and consider them in a simplified way.

Embedded software

System software, basic program in the device, virtually the →runtime system.
The firmware establishes the connection between the hardware of the device and the application program. The firmware is provided by the manufacturer of the controller as a part of the system and cannot be changed by the user.

EMC

EMC = **E**lectro **M**agnetic **C**ompatibility.
According to the EC directive (2004/108/EEC) concerning electromagnetic compatibility (in short EMC directive) requirements are made for electrical and electronic apparatus, equipment, systems or components to operate satisfactorily in the existing electromagnetic environment. The devices must not interfere with their environment and must not be adversely influenced by external electromagnetic interference.

EMCY

Abbreviation for emergency
Message in the CANopen protocol with which errors are signalled.

Ethernet

Ethernet is a widely used, manufacturer-independent technology which enables data transmission in the network at a speed of 10...10 000 million bits per second (Mbps). Ethernet belongs to the family of so-called "optimum data transmission" on a non exclusive transmission medium. The concept was developed in 1972 and specified as IEEE 802.3 in 1985.

EUC

EUC = **E**quipment **U**nder **C**ontrol.
EUC is equipment, machinery, apparatus or plant used for manufacturing, process, transportation, medical or other activities (→ IEC 61508-4, section 3.2.3). Therefore, the EUC is the set of all equipment, machinery, apparatus or plant that gives rise to hazards for which the safety-related system is required. If any reasonably foreseeable action or inaction leads to →hazards with an intolerable risk arising from the EUC, then safety functions are necessary to achieve or maintain a safe state for the EUC. These safety functions are

performed by one or more safety-related systems.

F

FiFo

FIFO (**F**irst **I**n, **F**irst **O**ut) = Operating principle of the stack memory: The data packet that was written into the stack memory first, will also be read first. Each identifier has such a buffer (queue).

Flash memory

Flash ROM (or flash EPROM or flash memory) combines the advantages of semiconductor memory and hard disks. Similar to a hard disk, the data are however written and deleted blockwise in data blocks up to 64, 128, 256, 1024, ... bytes at the same time.

Advantages of flash memories

- The stored data are maintained even if there is no supply voltage.
- Due to the absence of moving parts, flash is noiseless and insensitive to shocks and magnetic fields.

Disadvantages of flash memories

- A storage cell can tolerate a limited number of write and delete processes:
  - Multi-level cells: typ. 10 000 cycles
  - Single level cells: typ. 100 000 cycles
- Given that a write process writes memory blocks of between 16 and 128 Kbytes at the same time, memory cells which require no change are used as well.

FRAM

FRAM, or also FeRAM, means **Fe**rroelectric **R**andom **A**ccess **M**emory. The storage operation and erasing operation is carried out by a polarisation change in a ferroelectric layer.
Advantages of FRAM as compared to conventional read-only memories:
- non-volatile,
- compatible with common EEPROMs, but:
- access time approx. 100 ns,
- nearly unlimited access cycles possible.

H

Heartbeat

The participants regularly send short signals. In this way the other participants can verify if a participant has failed.

HMI

HMI = **H**uman **M**achine **I**nterface

I

ID

ID = **Id**entifier

Name to differentiate the devices / participants connected to a system or the message packets transmitted between the participants.

IEC 61131

Standard: Basics of programmable logic controllers
- Part 1: General information
- Part 2: Production equipment requirements and tests
- Part 3: Programming languages
- Part 5: Communication
- Part 7: Fuzzy Control Programming

IEC user cycle

IEC user cycle = PLC cycle in the CODESYS application program.

Instructions

Superordinate word for one of the following terms:
installation instructions, data sheet, user information, operating instructions, device manual, installation information, online help, system manual, programming manual, etc.

Intended use

Use of a product in accordance with the information provided in the instructions for use.

IP address

IP = **I**nternet **P**rotocol.
The IP address is a number which is necessary to clearly identify an internet participant. For the sake of clarity the number

© ifm electronic gmbh www.ifm.com

is written in 4 decimal values, e.g. 127.215.205.156.

ISO 11898

Standard: Road vehicles – Controller area network
- Part 1: Data link layer and physical signalling
- Part 2: High-speed medium access unit
- Part 3: Low-speed, fault-tolerant, medium dependent interface
- Part 4: Time-triggered communication
- Part 5: High-speed medium access unit with low-power mode

ISO 11992

Standard: Interchange of digital information on electrical connections between towing and towed vehicles
- Part 1: Physical and data-link layers
- Part 2: Application layer for brakes and running gear
- Part 3: Application layer for equipment other than brakes and running gear
- Part 4: Diagnostics

ISO 16845

Standard: Road vehicles – Controller area network (CAN) – Conformance test plan

J

J1939

→ SAE J1939

L

LED

LED = **L**ight **E**mitting **D**iode.
Light emitting diode, also called luminescent diode, an electronic element of high coloured luminosity at small volume with negligible power loss.

Link

A link is a cross-reference to another part in the document or to an external document.

LSB

Least **S**ignificant **B**it/Byte

M

MAC-ID

MAC = **M**anufacturer's **A**ddress **C**ode
= manufacturer's serial number.
→ID = **Id**entifier
Every network card has a MAC address, a clearly defined worldwide unique numerical code, more or less a kind of serial number. Such a MAC address is a sequence of 6 hexadecimal numbers, e.g. "00-0C-6E-D0-02-3F".

Master

Handles the complete organisation on the bus. The master decides on the bus access time and polls the →slaves cyclically.

Misuse

The use of a product in a way not intended by the designer.
The manufacturer of the product has to warn against readily predictable misuse in his user information.

MMI

→ HMI (→ p. 255)

MRAM

MRAM = **M**agnetoresistive **R**andom **A**ccess **M**emory
The information is stored by means of magnetic storage elements. The property of certain materials is used to change their electrical resistance when exposed to magnetic fields.
Advantages of MRAM as compared to conventional RAM memories:
- non volatile (like FRAM), but:
- access time only approx. 35 ns,
- unlimited number of access cycles possible.

MSB

Most **S**ignificant **B**it/Byte

N

NMT

NMT = **N**etwork **M**anagemen**t** = (here: in the CANopen protocol).

© ifm electronic gmbh www.ifm.com

The NMT master controls the operating states of the NMT slaves.

Node

This means a participant in the network.

Node Guarding

Node = here: network participant
Configurable cyclic monitoring of each →slave configured accordingly. The →master verfies if the slaves reply in time. The slaves verify if the master regularly sends requests. In this way failed network participants can be quickly identified and reported.

O

Obj / object

Term for data / messages which can be exchanged in the CANopen network.

Object directory

Contains all CANopen communication parameters of a device as well as device-specific parameters and data.

OBV

Contains all CANopen communication parameters of a device as well as device-specific parameters and data.

OPC

OPC = **O**LE for **P**rocess **C**ontrol
Standardised software interface for manufacturer-independent communication in automation technology
OPC client (e.g. device for parameter setting or programming) automatically logs on to OPC server (e.g. automation device) when connected and communicates with it.

Operational

Operating state of a CANopen participant. In this mode →SDOs, →NMT commands and →PDOs can be transferred.

P

PC card

→PCMCIA card

PCMCIA card

PCMCIA = Personal Computer Memory Card International Association, a standard for expansion cards of mobile computers.
Since the introduction of the cardbus standard in 1995 PCMCIA cards have also been called PC card.

PDM

PDM = **P**rocess and **D**ialogue **M**odule.
Device for communication of the operator with the machine / plant.

PDO

PDO = **P**rocess **D**ata **O**bject.
The time-critical process data is transferred by means of the "process data objects" (PDOs). The PDOs can be freely exchanged between the individual nodes (PDO linking). In addition it is defined whether data exchange is to be event-controlled (asynchronous) or synchronised. Depending on the type of data to be transferred the correct selection of the type of transmission can lead to considerable relief for the →CAN bus.
According to the protocol, these services are unconfirmed data transmission: it is not checked whether the receiver receives the message. Exchange of network variables corresponds to a "1 to n connection" (1 transmitter to n receivers).

PDU

PDU = **P**rotocol **D**ata **U**nit.
The PDU is an item of the →CAN protocol →SAE J1939. PDU indicates a part of the destination or source address.

PES

Programmable **E**lectronic **S**ystem ...
- for control, protection or monitoring,
- dependent for its operation on one or more programmable electronic devices,
- including all elements of the system such as input and output devices.

PGN

PGN = **P**arameter **G**roup **N**umber
PGN = PDU format (PF) + PDU source (PS)
The parameter group number is an item of the →CAN protocol →SAE J1939. PGN collects the address parts PF and PS.

© ifm electronic gmbh www.ifm.com

Pictogram

Pictograms are figurative symbols which convey information by a simplified graphic representation. (→ chapter **What do the symbols and formats mean?**)

PID controller

The PID controller (proportional–integral–derivative controller) consists of the following parts:
- P = proportional part
- I = integral part
- D = differential part (but not for the controller CR04nn, CR253n).

PLC configuration

Part of the CODESYS user interface.

► The programmer tells the programming system which hardware is to be programmed.

> CODESYS loads the corresponding libraries.

> Reading and writing the periphery states (inputs/outputs) is possible.

Pre-Op

Pre-Op = PRE-OPERATIONAL mode.
Operating status of a CANopen participant.
After application of the supply voltage each participant automatically passes into this state.
In the CANopen network only →SDOs and →NMT commands can be transferred in this mode but no process data.

Process image

Process image is the status of the inputs and outputs the PLC operates with within one →cycle.

- At the beginning of the cycle the PLC reads the conditions of all inputs into the process image.
  During the cycle the PLC cannot detect changes to the inputs.
- During the cycle the outputs are only changed virtually (in the process image).
- At the end of the cycle the PLC writes the virtual output states to the real outputs.

PWM

PWM = pulse width modulation
The PWM output signal is a pulsed signal between GND and supply voltage.
Within a defined period (PWM frequency) the mark-to-space ratio is varied. Depending on the mark-to-space ratio, the connected load determines the corresponding RMS current.

R

ratiometric

Measurements can also be performed ratiometrically. If the output signal of a sensor is proportional to its suppy voltage then via ratiometric measurement (= measurement proportional to the supply) the influence of the supply's fluctuation can be reduced, in ideal case it can be eliminated.
→ analogue input

RAW-CAN

RAW-CAN means the pure CAN protocol which works without an additional communication protocol on the CAN bus (on ISO/OSI layer 2). The CAN protocol is international defined according to ISO 11898-1 and garantees in ISO 16845 the interchangeability of CAN chips in addition.

remanent

Remanent data is protected against data loss in case of power failure.
The →runtime system for example automatically copies the remanent data to a →flash memory as soon as the voltage supply falls below a critical value. If the voltage supply is available again, the runtime system loads the remanent data back to the RAM memory.
The data in the RAM memory of a controller, however, is volatile and normally lost in case of power failure.

ro

RO = read only for reading only
Unidirectional data transmission: Data can only be read and not changed.

RTC

RTC = **R**eal **T**ime **C**lock
Provides (batter-backed) the current date and

© ifm electronic gmbh

time. Frequent use for the storage of error message protocols.

Runtime system

Basic program in the device, establishes the connection between the hardware of the device and the application program.

rw

RW = read/ write
Bidirectional data transmission: Data can be read and also changed.

S

SAE J1939

The network protocol SAE J1939 describes the communication on a →CAN bus in commercial vehicles for transmission of diagnosis data (e.g.engine speed, temperature) and control information.
Standard: Recommended Practice for a Serial Control and Communications Vehicle Network
- Part 2: Agricultural and Forestry Off-Road Machinery Control and Communication Network
- Part 3: On Board Diagnostics Implementation Guide
- Part 5: Marine Stern Drive and Inboard Spark-Ignition Engine On-Board Diagnostics Implementation Guide
- Part 11: Physical Layer – 250 kBits/s, Shielded Twisted Pair
- Part 13: Off-Board Diagnostic Connector
- Part 15: Reduced Physical Layer, 250 kBits/s, Un-Shielded Twisted Pair (UTP)
- Part 21: Data Link Layer
- Part 31: Network Layer
- Part 71: Vehicle Application Layer
- Part 73: Application Layer – Diagnostics
- Part 81: Network Management Protocol

SD card

An SD memory card (short for **S**ecure **D**igital Memory Card) is a digital storage medium that operates to the principle of →flash storage.

SDO

SDO = **S**ervice **D**ata **O**bject.
The SDO is used for access to objects in the CANopen object directory. 'Clients' ask for the requested data from 'servers'. The SDOs always consist of 8 bytes.

Examples:
- Automatic configuration of all slaves via →SDOs at the system start,
- reading error messages from the →object directory.

Every SDO is monitored for a response and repeated if the slave does not respond within the monitoring time.

Self-test

Test program that actively tests components or devices. The program is started by the user and takes a certain time. The result is a test protocol (log file) which shows what was tested and if the result is positive or negative.

Slave

Passive participant on the bus, only replies on request of the →master. Slaves have a clearly defined and unique →address in the bus.

stopped

Operating status of a CANopen participant. In this mode only →NMT commands are transferred.

Symbols

Pictograms are figurative symbols which convey information by a simplified graphic representation. (→ chapter **What do the symbols and formats mean?**)

System variable

Variable to which access can be made via IEC address or symbol name from the PLC.

T

Target

The target contains the hardware description of the target device for CODESYS, e.g.: inputs and outputs, memory, file locations. Corresponds to an electronic data sheet.

TCP

The **T**ransmission **C**ontrol **P**rotocol is part of the TCP/IP protocol family. Each TCP/IP data connection has a transmitter and a receiver. This principle is a connection-oriented data transmission. In the TCP/IP protocol family the TCP as the connection-oriented protocol

assumes the task of data protection, data flow control and takes measures in the event of data loss. (compare: →UDP)

Template

A template can be filled with content.
Here: A structure of pre-configured software elements as basis for an application program.

U

UDP

UDP (**U**ser **D**atagram **P**rotocol) is a minimal connectionless network protocol which belongs to the transport layer of the internet protocol family. The task of UDP is to ensure that data which is transmitted via the internet is passed to the right application.
At present network variables based on →CAN and UDP are implemented. The values of the variables are automatically exchanged on the basis of broadcast messages. In UDP they are implemented as broadcast messages, in CAN as →PDOs.
According to the protocol, these services are unconfirmed data transmission: it is not checked whether the receiver receives the message. Exchange of network variables corresponds to a "1 to n connection"
(1 transmitter to n receivers).

Use, intended

Use of a product in accordance with the information provided in the instructions for use.

W

Watchdog

In general the term watchdog is used for a component of a system which watches the function of other components. If a possible malfunction is detected, this is either signalled or suitable program branchings are activated. The signal or branchings serve as a trigger for other co-operating system components to solve the problem.

WO

WO = write only
Unidirectional data transmission: Data can only be changed and not read.
